ENVVEST Ambient Monitoring (AMB08)
ENVVEST September 2011
Metals in Water

DATA QUALIFIERS:

c	Exceeds DQO but meets contingency criteria of either:
1	SRM certified <10x MDL
2	Insufficient spiking level relative to native sample concentrations
3	Sample concentration <10x MDL
U	Analyte not detected at or above the MDL, MDL reported
J	Analyte detected above the MDL, but less than the RL
--	Not analyzed
NA	Not applicable/available
N	Spiked sample recovery outside QC criterion of 70-130%
NC	Not Certified
&	Accuracy result outside QC criterion of ≤20% PD
*	Precision result outside QC criterion of <30%
NS	Sample not spiked for this analyte
B	Analyte detected in the method blank > RL and sample concentration < 10 times detected blank value
b	Data are blank corrected using the batch specific procedural blank

QA/QC NARRATIVE

PROJECT: Sinclair and Dyes Inlet Ambient Monitoring, September 2011 (AMB08)

PARAMETER: Total and Dissolved Metals – Al, Ag, As (Total only), Cd, Cr, Cu, Pb, Zn, Hg
Total Suspended Solids (TSS)

LABORATORY: Battelle Marine Sciences Laboratory (MSL), Sequim, Washington

MATRIX: Seawater

SAMPLE CUSTODY AND PROCESSING: Samples were collected from Sinclair and Dyes Inlet region by MSL and the U.S. Navy on 09/20/11 and 09/21/11. Samples were hand delivered the day of collection to MSL by the field team. All samples were received in good condition. Samples were assigned a Battelle Central File (CF) identification number (3106) and were entered into Battelle's sample tracking system. Upon receipt at MSL, the samples designated for total and dissolved metals (TME/DME) were shaken vigorously and approximately 500mL was filtered through a pre-cleaned 0.45µm polyvinylidene fluoride (PVDF) filter membrane inside a class 100 clean bench and the filtrate was transferred to a trace metal clean Teflon bottle. The dissolved and total fractions were each acidified to a pH of < 2.0 with double distilled nitric acid. The samples for TSS were stored at 4.0±2°C in low density polyethylene bottles prior to analysis.

The following lists information on sample receipt and processing activities:

Sample Receipt Dates:	09/20/11 and 09/21/11
Cooler temp. on arrival	All coolers were at 4.0±2°C
Collection dates	09/20/11 and 09/21/11
TSS analysis dates	09/23/2011
CVAF analysis dates (Hg)	09/25/11 through 09/29/11
TRM Prep/Freshwater Analysis by ICP-MS (Ag, Al, Cd, Cr, Cu, Ni, Pb, Zn)	10/11/11
Fe/Pd Preconcentration Seawater Analysis by ICP-MS (Ag, Al, Cd, Cr, Cu, Ni, Pb, Zn)	09/26/11, 09/27/11, 10/04/11
FIAS analysis date (As)	09/27/11

QA/QC NARRATIVE

QA/QC DATA QUALITY OBJECTIVES FOR SEAWATER SAMPLES:

Analyte	Analytical Method for Seawater	MS Range of Recovery	SRM Percent Difference	Replicate Precision	Method Detection Limits (µg/L)	Reporting Limits (µg/L)
TSS	SM2540D	NA	≤20%	NA	0.5 mg/L	0.5 mg/L
Aluminum	ICP-MS	70-130%	≤20%	≤30%	2.14	6.8
Arsenic	FIAS	70-130%	≤20%	≤30%	0.0267	0.085

Zinc	ICP-MS	70-130%	≤20%	≤30%	0.02	0.06
Mercury	CVAF	70-130%	≤20%	≤30%	0.0001	0.00032

METHODS:

Seawater samples were analyzed for ten metals: aluminum (Al), arsenic (As), cadmium (Cd), chromium (Cr), copper (Cu), nickel (Ni), lead (Pb), silver (Ag), zinc (Zn), and mercury (Hg). Samples were submitted for analyses following three methods. The analyses of As and Hg do not require a salt removal technique prior to analyses, therefore, the data are not reported as reagent blank corrected (identified as a "b" qualifier) for these elements. All samples were analyzed for Hg by Cold Vapor Atomic Fluorescence (CVAF) in accordance with Battelle SOP *MSL-I-013*, *Total Mercury in Aqueous Samples by CVAF*, following EPA Method 1631 revision E. The samples for total metals (TME) were analyzed for As by Flow-Injection Atomic Spectroscopy (FIAS) in accordance with Battelle SOP *MSL-I-030, Determination of Metals in Aqueous and Digestate Samples by Hydride Generation Atomic Absorption (HGAA) with Flow Injection (FIAS).* The base method for this procedure is EPA Method 270.3.

Prior to analyses of all other metals, seawater samples were preconcentrated via a

METHODS (cont): precipitation step followed by reconstituted in a salt free solution in accordance with Battelle SOP *MSL-I-025, Methods of Sample Preconcentration: Iron and Palladium/APDC Coprecipitation and Borohydride Reductive Precipitation for Trace Metals Analysis in Water.* Preconcentrated seawater samples were analyzed for Al (total only), Ag, Cd, Cr, Cu, Pb and Zn by Inductively Coupled Plasma-Mass Spectrometry (ICP-MS) in accordance with Battelle SOP *MSL-I-022, Determination of Elements in Aqueous and Digestate Samples by ICP/MS.* The base methods for this procedure are EPA Method 1638 and EPA Method 1640. Freshwater samples were digested using the total metal recoverable (TRM) method established in EPA Method 1640 prior to analysis by ICP-MS following SOP MSL-I-022.

All metal results were reported in units of µg/L. Data are reported as blank corrected for the metals requiring Fe/Pd preconcentration (Al, Ag, Cd, Cr, Cu, Ni, Pb, and Zn) and denoted with a b-flag. The required preconcentration procedure for ICP-MS analyses includes the addition of chelating agents to induce precipitation of metals under specific conditions. Subsequently, reagents added to the samples should be of the purest quality to result in zero addition of metals to the seawater samples. Required reagents have trace impurities of these metals; therefore, the data are blank corrected for these elements. Results were corrected using the mean batch reagent blank identified for each preparation batch as BMRB_analysis date and provided in the table identified as the QC Results for ICP-MS.

Freshwater samples such as equipment blank samples and field samples identified as < 5% seawater were analyzed as follows. Freshwater samples were analyzed for Hg and As as described above for the seawater. These methods are not selective to salt content and the same for both the seawater and freshwater matrices. The other metals were determined by ICP-MS following the preparation method for total recoverable metals (TRM) described in EPA Method 1640 followed by analyses by ICP-MS.

The TSS samples were analyzed following SM2540D using a gravimetric analysis. The data are reported in units of mg/L.

HOLDING TIMES: All samples were analyzed within the established holding times of 90 days for Hg, six months for all other metals, and 7 days for TSS.

DETECTION LIMITS: Laboratory method detection limits (MDLs) for seawater are reported from the Annual Seawater MDL Study as determined by seven replicates of Sequim Bay Seawater spiked at an appropriate concentration for each analyte. The freshwater MDL was reported from the Annual Freshwater MDL Study determined using seven replicates of deionized water prepared using the TRM preparation. Reporting limits are determined as 3.18 times the laboratory achieved MDL. The data are evaluated and flagged as follows:

U Analyte not detected at or above the MDL, MDL reported
J Analyte detected above the MDL, but less than the RL
N Spiked sample recovery outside QC criterion of 70-130%
& Accuracy result outside QC criterion of ≤20% PD
* Precision result outside QC criterion of <30%
B Analyte detected in the method blank > RL and sample concentration < 10 times detected blank value
c Exceeds data quality objective but meets contingency criterion
b Result is reagent blank corrected using the batch specific blank (BMRB)

METHOD BLANKS: A minimum of three method blanks were analyzed by each instrument with each analytical batch for metals. The average method blank for each batch was less than the RL for all metals. The required seawater preconcentration procedure to remove salt

interferences prior to ICP-MS analysis includes the addition of chelating agents to induce precipitation of metals under specific conditions as discussed in the method section above. The data were evaluated and qualified with a "B" if the sample concentration was less than ten times the mean detected blank detected above the RL for the analytical batch. The reagent blank correction takes into consideration the detected blank for each batch and the data should be reported as corrected in order to more accurately represent the sample concentrations.

The method blank for TSS is a glass fiber filter taken through the analytical process with each batch of samples. The blanks were all less than the MDL.

LABORATORY CONTROL SAMPLES:

A minimum of one LCS (OPR or blank spike) was prepared and analyzed with each analytical batch of 20 or fewer samples. Percent recoveries for LCS samples were within the QC acceptance criterion of 70% to 130% for all metals. The LCS matrix for the seawater samples was Sequim Bay Seawater prepared as both spiked and unspiked samples.

MATRIX SPIKE ACCURACY:

A minimum of one set of duplicate matrix spikes (MS/MSD) was prepared and analyzed with each analytical batch of 20 or fewer samples. Percent recoveries for matrix spikes were within the QC limits of 70% to 130% for all metals. The spiking level was not optimized to Al; therefore several matrix spikes were not fortified at levels appropriate for the native sample concentration. These spikes are qualified as insufficient spiking level. There was no impact to data quality as Al is an ancillary parameter.

REPLICATE PRECISION:

Laboratory precision was expressed as the relative percent difference (RPD) between laboratory duplicates. The RPD values for the laboratory duplicates were within the QC acceptance criterion of ±30% for all metals detected above the RL.

STANDARD REFERENCE MATERIAL ACCURACY:

Standard reference materials (SRM) were prepared and analyzed with each analytical batch at a minimum frequency of 1 per 20 or fewer samples. Analytical accuracy was expressed as the percent difference (PD) between the measured and the certified value. The SRM for Hg was 1641d, a freshwater SRM, as no seawater SRM was available. The percent recoveries were within the QC acceptance criterion of 80-120%. The SRM for As was the coastal ocean SRM CASS-4. The percent recoveries were within the QC acceptance criterion.

Three different SRMs were analyzed with the analytical batches for Al, Ag, Cd, Cr, Cu, Ni, Pb, and Zn quantified by ICP-MS. The freshwater SRM 1640d demonstrated analytical accuracy for each batch analyzed by ICP-MS and the freshwater sample matrices (e.g. equipment blanks and outfall 021). Percent recoveries were within the QC acceptance criterion.

Two seawater SRMs were analyzed with each batch. The primary SRM was the coastal SRM CASS-5 and the secondary was the estuarine SRM SLEW-2 for Zn. Both ere prepared with each batch of preconcentrated samples. The PD were within the QC criterion for all metals except two replicates for Pb and two for Zn. The certified value for Pb in CASS-5 was less than the RL and should be evaluated with qualification. The PDs were flagged with a "c" indicating they meet the contingency criterion. The alternate SRM for Zn was SLEW-2, which demonstrated that all batches had acceptable accuracy for Zn in a seawater based SRM. There are no seawater SRMs certified for Ag or Al. High purity standards and the freshwater SRM were used to evaluate analytical accuracy for these metals. The percent differences were within the QC acceptance criterion for all other metals.

COLUMBIA ANALYTICAL SERVICES, INC.

Client:	Battelle	**Service Request No.:**	K1109025
Project:	September 2011 AMB08	**Date Received:**	9/23/11
Sample Matrix:	Seawater/Water		

CASE NARRATIVE

All analyses were performed consistent with the quality assurance program of Columbia Analytical Services, Inc. (CAS). This report contains analytical results for samples designated for Tier IV validation deliverables including summary forms and all of the associated raw data for each of the analyses. When appropriate to the method, method blank results have been reported with each analytical test.

Sample Receipt

Ninety-five seawater/water samples were received for analysis at Columbia Analytical Services on 9/23/11. The samples were received in good condition and consistent with the accompanying chain of custody form. The samples were stored in a refrigerator at 4°C upon receipt at the laboratory.

General Chemistry Parameters

Total Oil and Grease by EPA Method 1664:
The matrix spike recovery of Total Oil and Grease for sample Batch QC was outside control criteria because of suspected matrix interference. As a result of the interference, the results for this analyte contained a potential low bias. No further corrective action was taken.

Nitrogen, Total Kjeldahl (TKN) by EPA Method 351.4:
The Relative Percent Difference (RPD) in the replicate matrix spike analyses of sample AMB08-270 M2DEEP was outside control criteria. All spike recoveries in the MS, DMS, and associated Laboratory Control Sample (LCS) were within acceptance limits, indicating the analytical batch was in control. No further corrective action was appropriate.

No other anomalies associated with the analysis of these samples were observed.

Approved by Howard Holum **Date** 10-11-11

Sample Name: AMB08-230 M8
Lab Code: K1109025-068

Units: mg/L
Basis: NA

Analyte Name	Method	MRL	MDL	Sample Result	AMB08-230 M8DUP Duplicate Sample K1109025-068DUP80 Result	Average	RPD	RPD Limit
Nitrate+Nitrite as Nitrogen	353.2	0.050	0.009	ND U	ND U	NC	NC	20

Results flagged with an asterisk (*) indicate values outside control criteria.
Results flagged with a pound (#) indicate the control criteria is not applicable.
Percent recoveries and relative percent differences (RPD) are determined by the software using values in the calculation which have not been rounded.

Lab Code: K1109025-094

Units: mg/L
Basis: NA

Analyte Name	Method	MRL	MDL	Sample Result	AMB08-282 BM01DUPDUP Duplicate Sample K1109025-094DUP106 Result	Average	RPD	RPD Limit
Phosphorus, Total	365.3	0.010	0.004	0.079	0.081	0.0797	2	20

Results flagged with an asterisk (*) indicate values outside control criteria.

Results flagged with a pound (#) indicate the control criteria is not applicable.

Percent recoveries and relative percent differences (RPD) are determined by the software using values in the calculation which have not been rounded.

ENVVEST Ambient Monitoring (AMB09)
ENVVEST December 2011
Metals in Water

DATA QUALIFIERS:

c	Exceeds DQO but meets contingency criteria of either:
1	SRM certified <10x MDL
2	Insufficient spiking level relative to native sample concentrations
3	Sample concentration <10x MDL
U	Analyte not detected at or above the MDL, MDL reported
J	Analyte detected above the MDL, but less than the RL
--	Not analyzed
NA	Not applicable/available
N	Spiked sample recovery outside QC criterion of 70-130%
NC	Not Certified
&	Accuracy result outside QC criterion of ≤20% PD
*	Precision result outside QC criterion of <30%
NS	Sample not spiked for this analyte
B	Analyte detected in the method blank > RL and sample concentration < 10 times detected blank value
b	Data are blank corrected using the batch specific procedural blank

QA/QC NARRATIVE

PROJECT: Sinclair and Dyes Inlet Ambient Monitoring, December 2011 (AMB09)

PARAMETER: Total and Dissolved Metals – Al, Ag, As (Total only), Cd, Cr, Cu, Pb, Zn, Hg
Total Suspended Solids (TSS), Salinity (OSAL)

LABORATORY: Battelle Marine Sciences Laboratory (MSL), Sequim, Washington

MATRIX: Seawater, Freshwater

SAMPLE CUSTODY AND PROCESSING: Samples were collected from Sinclair and Dyes Inlet region by MSL and the U.S. Navy on 12/06/11, 12/07/11 and 12/12/11. Samples were hand delivered to MSL by the field team. All samples were received in good condition. Samples were assigned a Battelle Central File (CF) identification number (3106) and were entered into Battelle's sample tracking system. Upon receipt at MSL, the samples designated for total and dissolved metals (TME/DME) were shaken vigorously and approximately 500mL was filtered through a pre-cleaned 0.45µm polyvinylidene fluoride (PVDF) filter membrane inside a class 100 clean bench and the filtrate was transferred to a trace metal clean Teflon bottle. The dissolved and total fractions were each acidified to a pH of < 2.0 with double distilled nitric acid. The samples for TSS and OSAL were stored at 4.0±2°C in low density polyethylene bottles prior to analysis.

The following lists information on sample receipt and processing activities:

Sample Receipt Dates:	12/06/11, 12/07/11, and 12/12/11
Cooler temp. on arrival	All coolers were at 4.0±2°C
Collection dates	12/06/11, 12/07/11, and 12/12/11
TSS analysis dates	12/12/11 and 12/13/11
OSAL analysis dates	12/12/11 and 12/13/11
CVAF analysis dates (Hg)	12/13/11 through 12/16/11 and 12/22/11
TRM Prep/Freshwater Analysis by ICP-MS (Ag, Al, Cd, Cr, Cu, Ni, Pb, Zn)	12/19/11
Fe/Pd Preconcentration Seawater Analysis by ICP-MS (Ag, Al, Cd, Cr, Cu, Ni, Pb, Zn)	12/21/11, 01/05/12, 01/06/12, and 01/12/12
FIAS analysis date (As)	01/04/12

METHODS:

Seawater samples were analyzed for ten metals: aluminum (Al), arsenic (As), cadmium (Cd), chromium (Cr), copper (Cu), nickel (Ni), lead (Pb), silver (Ag), zinc (Zn), and mercury (Hg). Samples were submitted for analyses following three methods. The analyses of As and Hg do not require a salt removal technique prior to analyses, therefore, the data are not reported as reagent blank corrected (identified as a "b" qualifier) for these elements. All samples were analyzed for Hg by Cold Vapor Atomic Fluorescence (CVAF) in accordance with Battelle SOP *MSL-I-013*, *Total Mercury in Aqueous Samples by CVAF*, following EPA Method 1631 revision E. The samples for total metals (TME) were analyzed for As by Flow-Injection Atomic Spectroscopy (FIAS) in accordance with Battelle SOP *MSL-I-030, Determination of Metals in Aqueous and Digestate Samples by Hydride Generation Atomic Absorption (HGAA) with Flow Injection (FIAS).* The base method for this procedure is EPA Method 270.3.

METHODS (cont): Prior to analyses of all other metals, seawater samples were preconcentrated via a precipitation step followed by reconstituted in a salt free solution in accordance with Battelle SOP *MSL-I-025, Methods of Sample Preconcentration: Iron and Palladium/APDC Coprecipitation and Borohydride Reductive Precipitation for Trace Metals Analysis in Water.* Preconcentrated seawater samples were analyzed for Al (total only), Ag, Cd, Cr, Cu, Pb and Zn by Inductively Coupled Plasma-Mass Spectrometry (ICP-MS) in accordance with Battelle SOP *MSL-I-022, Determination of Elements in Aqueous and Digestate Samples by ICP/MS.* The base methods for this procedure are EPA Method 1638 and EPA Method 1640. Freshwater samples were digested using the total metal recoverable (TRM) method established in EPA Method 1640 prior to analysis by ICP-MS following SOP MSL-I-022.

All metal results were reported in units of µg/L. Data are reported as blank corrected for the metals requiring Fe/Pd preconcentration (Al, Ag, Cd, Cr, Cu, Ni, Pb, and Zn) and denoted with a b-flag. The required preconcentration procedure for ICP-MS analyses includes the addition of chelating agents to induce precipitation of metals under specific conditions. Subsequently, reagents added to the samples should be of the purest quality to result in zero addition of metals to the seawater samples. Required reagents have trace impurities of these metals; therefore, the data are blank corrected for these elements. Results were corrected using the mean batch reagent blank identified for each preparation batch as BMRB_analysis date and provided in the table identified as the QC Results for ICP-MS.

Freshwater samples such as equipment blank samples and field samples identified as < 5% seawater were analyzed as follows. Freshwater samples were analyzed for Hg and As as described above for the seawater. These methods are not selective to salt content and the same for both the seawater and freshwater matrices. The other metals were determined by ICP-MS following the preparation method for total recoverable metals (TRM) described in EPA Method 1640 followed by analyses by ICP-MS.

The TSS samples were analyzed following SM2540D using a gravimetric analysis. The data are reported in units of mg/L. The OSAL samples were measured using a YSI-30 S-C-T probe. The data are reported in practical salinity units (PSU).

HOLDING TIMES: All samples were analyzed within the established holding times of 90 days for Hg, six months for all other metals, and 7 days for TSS.

DETECTION LIMITS: Laboratory method detection limits (MDLs) for seawater are reported from the Annually Verified Seawater MDL Study as determined by seven replicates of Sequim Bay Seawater spiked at an appropriate concentration for each analyte. The freshwater MDL was reported from the Annually Verified Freshwater MDL Study determined using seven replicates of deionized water prepared using the TRM preparation. Reporting limits are determined as 3.18 times the laboratory achieved MDL. The data are evaluated and flagged as follows:

U Analyte not detected at or above the MDL, MDL reported
J Analyte detected above the MDL, but less than the RL
N Spiked sample recovery outside QC criterion of 70-130%
& Accuracy result outside QC criterion of ≤20% PD
* Precision result outside QC criterion of <30%
B Analyte detected in the method blank > RL and sample concentration < 10 times detected blank value
c Exceeds data quality objective but meets contingency criterion
b Result is reagent blank corrected using the batch specific blank (BMRB)

QA/QC NARRATIVE

METHOD BLANKS: A minimum of three method blanks were analyzed by each instrument with each analytical batch for metals. The average method blank for each batch was less than the RL for all metals except Zn due to contributions from the Fe/Pd reagents. The seawater preconcentration procedure required to remove salt interferences prior to ICP-MS analysis includes the addition of chelating agents to induce precipitation of metals under specific conditions as discussed in the method section above. The data were evaluated and qualified with a "B" if the sample concentration was less than ten times the mean detected blank detected above the RL for the analytical batch. The reagent blank correction takes into consideration the detected blank for each batch and the data should be reported as corrected in order to more accurately represent the sample concentrations.

The method blank for TSS is a glass fiber filter taken through the analytical process with each batch of samples. The blanks were all less than the MDL.

LABORATORY CONTROL SAMPLES: A minimum of one LCS (OPR or blank spike) was prepared and analyzed with each analytical batch of 20 or fewer samples. Percent recoveries for LCS samples were within the QC acceptance criterion of 70% to 130% for all metals. The LCS matrix for the seawater samples was Sequim Bay Seawater prepared as both spiked and unspiked samples.

MATRIX SPIKE ACCURACY: A minimum of one set of duplicate matrix spikes (MS/MSD) was prepared and analyzed with each analytical batch of 20 or fewer samples. Percent recoveries for matrix spikes were within the QC limits of 70% to 130% for all metals. The spiking level was not optimized to Al; therefore several matrix spikes were not fortified at levels appropriate for the native sample concentration. These spikes are qualified as insufficient spiking level. There was no impact to data quality as Al is an ancillary parameter.

REPLICATE PRECISION: Laboratory precision was expressed as the relative percent difference (RPD) between laboratory duplicates. The RPD values for the laboratory duplicates were within the QC acceptance criterion of ±30% for all metals detected above the RL.

STANDARD REFERENCE MATERIAL ACCURACY: Standard reference materials (SRM) were prepared and analyzed with each analytical batch at a minimum frequency of 1 per 20 or fewer samples. Analytical accuracy was expressed as the percent difference (PD) between the measured and the certified value. The SRM for Hg was 1641d, a freshwater SRM, as no seawater SRM was available. The percent recoveries were within the QC acceptance criterion of 80-120%. The SRM for As was the coastal ocean SRM CASS-4. The percent recoveries were within the QC acceptance criterion.

Three different SRMs were analyzed with the analytical batches for Al, Ag, Cd, Cr, Cu, Ni, Pb, and Zn quantified by ICP-MS. The freshwater SRM 1640d demonstrated analytical accuracy for each batch analyzed by ICP-MS and the freshwater sample matrices (e.g. equipment blanks and outfall 021). Percent recoveries were within the QC acceptance criterion. There are no seawater SRMs certified for Ag or Al. High purity standards and the freshwater SRM were used to evaluate analytical accuracy.

Two seawater SRMs were analyzed with each batch. The primary SRM was the coastal SRM CASS-5 and the secondary was the estuarine SRM SLEW-2. Both were prepared with each batch of preconcentrated samples. The PDs were within the QC criterion for all metals certified greater than 10x the MDL. The only exceptions were: all replicates of CASS-5 for Cd, but all replicates of SLEW-2 were acceptable; one replicate of CASS-5 for Cr and one replicate of SLEW-2 for Cr, both PDs were

flagged with a “c1” indicating they meet the contingency criterion #1; and all replicates of SLEW-2 for Pb were flagged with a “c3” indicating they meet the contingency criterion #3.

ANALYTICAL NOTES: Three of the TSS results are reported “NA” due to tears in the filter during sample processing.

COLUMBIA ANALYTICAL SERVICES, INC.

Client:	Battelle	**Service Request No.:**	K1111962
Project:	ENVVEST AMB09	**Date Received:**	12/9/11
Sample Matrix:	Water		

CASE NARRATIVE

All analyses were performed consistent with the quality assurance program of Columbia Analytical Services, Inc. (CAS). This report contains analytical results for samples designated for Tier IV validation deliverables including summary forms and all of the associated raw data for each of the analyses. When appropriate to the method, method blank results have been reported with each analytical test.

Sample Receipt

Forty-three water samples were received for analysis at Columbia Analytical Services on 12/9/11. The samples were received in good condition and consistent with the accompanying chain of custody form. The samples were stored in a refrigerator at 4°C upon receipt at the laboratory.

General Chemistry Parameters

Total Oil and Grease by EPA Method 1664A:
The matrix spike recovery of Total Oil and Grease for the Batch QC sample was outside control criteria because of suspected matrix interference. As a result of the interference, the results for this analyte contained a potential low bias. No further corrective action was taken.

Total Organic Carbon by SM 5310 C:
The Relative Percent Difference (RPD) criterion for the replicate analysis of Total Organic Carbon in samples AMB09-001 PS03, AMB09-007 PS08 and AMB09-104 WP were not applicable because the analyte concentration was not significantly greater than the Method Reporting Limit (MRL). Analytical values derived from measurements close to the detection limit are not subject to the same accuracy and precision criteria as results derived from measurements higher on the calibration range for the method.

No other anomalies associated with the analysis of these samples were observed.

Analyte Name	**Sample Result**	**Result**	**Spike Amount**	**% Rec**	**Result**	**Spike Amount**	**% Rec**	**% Rec Limits**	**RPD**	**RPD Limit**
Nitrogen, Total Kjeldahl (TKN)	2.0	62.0	50.0	120	116	100	114	40 - 160	5	20

Results flagged with an asterisk (*) indicate values outside control criteria.

Results flagged with a pound (#) indicate the control criteria is not applicable.

Percent recoveries and relative percent differences (RPD) are determined by the software using values in the calculation which have not been rounded.

COLUMBIA ANALYTICAL SERVICES, INC.

Client:	Battelle	**Service Request No.:**	K1112090
Project:	December 2011 AMB 09	**Date Received:**	12/14/11
Sample Matrix:	Water		

CASE NARRATIVE

All analyses were performed consistent with the quality assurance program of Columbia Analytical Services, Inc. (CAS). This report contains analytical results for samples designated for Tier IV validation deliverables including summary forms and all of the associated raw data for each of the analyses. When appropriate to the method, method blank results have been reported with each analytical test.

Sample Receipt

One water sample was received for analysis at Columbia Analytical Services on 12/14/11. The samples were received in good condition and consistent with the accompanying chain of custody form. The samples were stored in a refrigerator at 4°C upon receipt at the laboratory.

General Chemistry Parameters

No anomalies associated with the analysis of these samples were observed.

Cooler Receipt and Preservation Form

Client / Project: Battelle Service Request K11 12090

Received: 12/14/11 Opened: 12/14/11 By: SRW Unloaded: 12/14/11 By: SRW

1. Samples were received via? *Mail* (*Fed Ex*) *UPS* *DHL* *PDX* *Courier* *Hand Delivered*
2. Samples were received in: (circle) (*Cooler*) *Box* *Envelope* *Other*_____ *NA*
3. Were custody seals on coolers? NA Y (N) If yes, how many and where?_____
   If present, were custody seals intact? Y N If present, were they signed and dated? Y N

Cooler Temp °C	Temp Blank °C	Thermometer ID	Cooler/COC ID NA	Tracking Number NA	Filed
-0.4	—	287		7978 3729 3997	

7. Packing material used. *Inserts* *Baggies* *Bubble Wrap* (*Gel Packs*) *Wet Ice* *Sleeves* *Other* paper
8. Were custody papers properly filled out (ink, signed, etc.)? NA (Y) N
9. Did all bottles arrive in good condition (unbroken)? *Indicate in the table below.* NA (Y) N
10. Were all sample labels complete (i.e analysis, preservation, etc.)? NA (Y) N
11. Did all sample labels and tags agree with custody papers? *Indicate major discrepancies in the table on page 2.* NA (Y) N
12. Were appropriate bottles/containers and volumes received for the tests indicated? NA (Y) N
13. Were the pH-preserved bottles (*see SMO GEN SOP*) received at the appropriate pH? *Indicate in the table below* NA (Y) N
14. Were VOA vials received without headspace? *Indicate in the table below.* (NA) Y N
15. Was C12/Res negative? (NA) Y N

Sample ID on Bottle	Sample ID on COC	Identified by:

Sample ID	Bottle Count Bottle Type	Out of Temp	Head-space	Broke	pH	Reagent	Volume added	Reagent Lot Number	Initials	Time

*Notes, Discrepancies, & Resolutions:*_____

Metals in Water

DATA QUALIFIERS:

c	Exceeds DQO but meets contingency criteria of either:
1	SRM certified <10x MDL
2	Insufficient spiking level relative to native sample concentrations
3	Sample concentration <10x MDL
U	Analyte not detected at or above the MDL, MDL reported
J	Analyte detected above the MDL, but less than the RL
--	Not analyzed
NA	Not applicable/available
N	Spiked sample recovery outside QC criterion of 70-130%
NC	Not Certified
&	Accuracy result outside QC criterion of ≤20% PD
*	Precision result outside QC criterion of <30%
NS	Sample not spiked for this analyte
B	Analyte detected in the method blank > RL and sample concentration < 10 times detected blank value
b	Data are blank corrected using the batch specific procedural blank
[1]	Reported from the nucleopore filtration method instead of GF/C filters
[2]	Seawater DOC CRM (LOT#03-12) and low carbon water (LCW) were purchased from University of Miami http://yyy.rsmas.miami.edu/groups/biogeochem/CRM.html
HTCO	High Temperature Catalytic Oxidation
E	Small crack in sample bottle; use with caution

PROJECT: Sinclair and Dyes Inlet Ambient Monitoring, March 2012 (AMB10)

PARAMETER: Total and Dissolved Metals – Al, Ag, As (Total only), Cd, Cr, Cu, Pb, Zn, Hg
Total Suspended Solids (TSS), Salinity (OSAL), Dissolved Organic Carbon (DOC), and Total Organic Carbon (TOC)

LABORATORY: Battelle Marine Sciences Laboratory (MSL), Sequim, Washington

MATRIX: Seawater, Freshwater

SAMPLE CUSTODY AND PROCESSING: Samples were collected from Sinclair and Dyes Inlet region by MSL and the U.S. Navy on 03/13/12, 03/14/12, and 03/16/12. Samples were hand delivered to MSL by the field team. All samples were received in good condition. Samples were assigned a Battelle Central File (CF) identification number (3106) and were entered into Battelle's sample tracking system. Upon receipt at MSL, the samples designated for total and dissolved metals (TME/DME) were shaken vigorously and approximately 500mL was filtered through a pre-cleaned 0.45µm polyvinylidene fluoride (PVDF) filter membrane inside a class 100 clean bench and the filtrate was transferred to a trace metal clean Teflon bottle. The dissolved and total fractions were each acidified to a pH of < 2.0 with double distilled nitric acid. The samples for TSS and OSAL were stored at 4.0±2°C in low density polyethylene bottles prior to analysis. The samples for TOC and DOC were collected in pre-cleaned glass and stored at -20°C until analyses.

The following lists information on sample receipt and processing activities:

Sample Receipt Dates:	3/13/12, 3/14/12, and 3/16/12
Cooler temp. on arrival	All coolers were at 4.0±2°C
Collection dates	3/13/12, 3/14/12, and 3/16/12
TSS analysis dates	03/19/12 through 03/21/12
OSAL analysis dates	03/16/12, 03/19/12, 03/20/12, 03/21/12
CVAF analysis dates (Hg)	03/22-03/23/12, 03/26-03/28/12
TRM Prep/Freshwater Analysis by ICP-MS (Ag, Al, Cd, Cr, Cu, Ni, Pb, Zn)	03/26/12
Fe/Pd Preconcentration Seawater Analysis by ICP-MS (Ag, Al, Cd, Cr, Cu, Ni, Pb, Zn)	03/27/12, 03/30/12, 04/05/12, 04/06/12, 04/12/12
FIAS analysis date (As)	03/30/12

METHODS:

Seawater samples were analyzed for ten metals: aluminum (Al), arsenic (As), cadmium (Cd), chromium (Cr), copper (Cu), nickel (Ni), lead (Pb), silver (Ag), zinc (Zn), and mercury (Hg). Samples were submitted for analyses following three methods. The analyses of As and Hg do not require a salt removal technique prior to analyses, therefore, the data are not reported as reagent blank corrected (identified as a "b" qualifier) for these elements. All samples were analyzed for Hg by Cold Vapor Atomic Fluorescence (CVAF) in accordance with Battelle SOP *MSL-I-013*, *Total Mercury in Aqueous Samples by CVAF*, following EPA Method 1631 revision E. The samples for total metals (TME) were analyzed for As by Flow-Injection Atomic Spectroscopy (FIAS) in accordance with Battelle SOP *MSL-I-030, Determination of Metals in Aqueous and Digestate Samples by Hydride Generation Atomic Absorption*

METHODS (cont): *(HGAA) with Flow Injection (FIAS).* The base method for this procedure is EPA Method 270.3.

Prior to analyses of all other metals, seawater samples were preconcentrated via a precipitation step followed by reconstituted in a salt free solution in accordance with Battelle SOP *MSL-I-025, Methods of Sample Preconcentration: Iron and Palladium/APDC Coprecipitation and Borohydride Reductive Precipitation for Trace Metals Analysis in Water*. Preconcentrated seawater samples were analyzed for Al (total only), Ag, Cd, Cr, Cu, Pb and Zn by Inductively Coupled Plasma-Mass Spectrometry (ICP-MS) in accordance with Battelle SOP *MSL-I-022, Determination of Elements in Aqueous and Digestate Samples by ICP/MS.* The base methods for this procedure are EPA Method 1638 and EPA Method 1640. Freshwater samples were digested using the total metal recoverable (TRM) method established in EPA Method 1640 prior to analysis by ICP-MS following SOP MSL-I-022.

All metal results were reported in units of µg/L. Data are reported as blank corrected for the metals requiring Fe/Pd preconcentration (Al, Ag, Cd, Cr, Cu, Ni, Pb, and Zn) and denoted with a b-flag. The required preconcentration procedure for ICP-MS analyses includes the addition of chelating agents to induce precipitation of metals under specific conditions. Subsequently, reagents added to the samples should be of the purest quality to result in zero addition of metals to the seawater samples. Required reagents have trace impurities of these metals; therefore, the data are blank corrected for these elements. Results were corrected using the mean batch reagent blank identified for each preparation batch as BMRB_analysis date and provided in the table identified as the QC Results for ICP-MS.

Freshwater samples such as equipment blank samples and field samples identified as < 5% seawater were analyzed as follows. Freshwater samples were analyzed for Hg and As as described above for the seawater. These methods are not selective to salt content and the same for both the seawater and freshwater matrices. The other metals were determined by ICP-MS following the preparation method for total recoverable metals (TRM) described in EPA Method 1640 followed by analyses by ICP-MS.

The TSS samples were analyzed following SM2540D using a gravimetric analysis. The data are reported in units of mg/L. The OSAL samples were measured using a YSI-30 S-C-T probe. The data are reported in practical salinity units (PSU).

The TOC and DOC samples were analyzed using a High Temperature Catalytic Oxidation (HTCO) method. The instrument is specially equipped with high-salt sample combustion tube kit and halogen scrubber for seawater analysis. Seawater samples were acidified to pH <2 by concentrated hydrochloric acid (trace metal grade, Fisher Chemical) prior to analysis then sparged for 2 min to remove inorganic carbon (IC). The non-purgeable organic carbons (NPOC) in samples were further converted to CO_2 by oxidation at 680°C with a platinum catalyst. A non-dispersive infrared detector (NDIR) was used to detect the converted CO_2 for quantification of NPOC. The data are reported as both mg/L and µM.

HOLDING TIMES: All samples were analyzed within the established holding times of 90 days for Hg, six months for all other metals, and 7 days for TSS.

DETECTION LIMITS: Laboratory method detection limits (MDLs) for seawater are reported from the Annually Verified Seawater MDL Study as determined by seven replicates of Sequim Bay Seawater spiked at an appropriate concentration for each analyte. The freshwater MDL was reported from the Annually Verified Freshwater MDL Study determined using seven replicates of deionized water prepared using the TRM preparation. Reporting limits are determined as 3.18 times the laboratory achieved MDL. The data

are evaluated and flagged as follows:

U Analyte not detected at or above the MDL, MDL reported
J Analyte detected above the MDL, but less than the RL
N Spiked sample recovery outside QC criterion of 70-130%
& Accuracy result outside QC criterion of ≤20% PD
* Precision result outside QC criterion of <30%
B Analyte detected in the method blank > RL and sample concentration < 10 times detected blank value
c Exceeds data quality objective but meets contingency criterion
b Result is reagent blank corrected using the batch specific blank (BMRB)

METHOD BLANKS: A minimum of three method blanks were analyzed by each instrument with each analytical batch for metals. The average method blank for each batch was less than the RL for all metals. The seawater preconcentration procedure required to remove salt interferences prior to ICP-MS analysis includes the addition of chelating agents to induce precipitation of metals under specific conditions as discussed in the method section above. The data were evaluated and qualified with a "B" if the sample concentration was less than ten times the mean detected blank detected above the RL for the analytical batch. The reagent blank correction takes into consideration the detected blank for each batch and the data should be reported as corrected in order to more accurately represent the true sample concentrations.

The method blank for TSS is a glass fiber (GF/C) filter taken through the analytical process with each batch of samples. The blanks were all less than the MDL. A secondary set of TSS samples was analyzed using a 0.45 μm nucleopore filter. The second set was used to evaluate potential biases from the GF/C filters. The second set is not reported for this batch excepted as footnoted in the data table, but the method will be considered for all future TSS analyses.

Low carbon water (LCW) was purchased from University of Miami and analyzed as part of the HTCO calibration curve to demonstrate that the instrumentation was not contributing carbon.

LABORATORY CONTROL SAMPLES: A minimum of one LCS (OPR or blank spike) was prepared and analyzed with each analytical batch of 20 or fewer samples. Percent recoveries for LCS samples were within the QC acceptance criterion of 70% to 130% for all metals. The LCS matrix for the seawater samples was Sequim Bay Seawater prepared as both spiked and unspiked samples.

MATRIX SPIKE ACCURACY: A minimum of one set of duplicate matrix spikes (MS/MSD) was prepared and analyzed with each analytical batch of 20 or fewer samples. Percent recoveries for matrix spikes were within the QC limits of 70% to 130% for all metals.

REPLICATE PRECISION: Laboratory precision was expressed as the relative percent difference (RPD) between laboratory duplicates. The RPD values for the laboratory duplicates were within the QC acceptance criterion of ±30% for all metals detected above the RL.

STANDARD REFERENCE MATERIAL ACCURACY: Standard reference materials (SRM) were prepared and analyzed with each analytical batch at a minimum frequency of 1 per 20 or fewer samples. Analytical accuracy was expressed as the percent difference (PD) between the measured and the certified value. The SRM for Hg was 1641d, a freshwater SRM, as no seawater SRM was available. The percent recoveries were within the QC acceptance criterion of 80-120%. The SRM for As was the coastal ocean SRM CASS-4. The percent recoveries were within the QC acceptance criterion.

Three different SRMs were analyzed with the analytical batches for Al, Ag, Cd, Cr, Cu, Ni, Pb, and Zn quantified by ICP-MS. The freshwater SRM 1640a demonstrated analytical accuracy for each batch analyzed by ICP-MS and the freshwater sample matrices (e.g. equipment blanks and outfall 021). Percent recoveries were within the QC acceptance criterion. There are no seawater SRMs certified for Ag or Al. High purity standards and the freshwater SRM were used to evaluate analytical accuracy.

Two seawater SRMs were analyzed with each batch. The primary SRM was the coastal SRM CASS-5 and the secondary was the estuarine SRM SLEW-2. Both were prepared with each batch of preconcentrated samples. The PDs were within the QC criterion for all metals certified greater than 10x the MDL. The only exception was one replicate of CASS-5 for Zn. All replicates of SLEW-2 for Zn demonstrated acceptable accuracy for Zn. All replicates of SLEW-2 for Pb were outside the criterion. This has been consistently demonstrated in previous batches. Since all replicates of CASS-5 demonstrated accuracy for Pb, the issues associated with SLEW-2 Pb do not appear to impact the quality of the Pb data.

There are no SRMs available for TOC or DOC. University of Miami provides a laboratory consensus value for DOC in estuarine water
http://yyy.rsmas.miami.edu/groups/biogeochem/CRM.html
The average of the reference value range was used to calculate the PD for each replicate. The PD ranged from 0.2-4.7%.

COLUMBIA ANALYTICAL SERVICES, INC.

Client:	Battelle	**Service Request No.:**	K1202450
Project:	March 2012 Ambient Monitoring (AMB10)	**Date Received:**	3/16/12
Sample Matrix:	Water		

CASE NARRATIVE

All analyses were performed consistent with the quality assurance program of Columbia Analytical Services, Inc. (CAS). This report contains analytical results for samples designated for Tier IV validation deliverables including summary forms and all of the associated raw data for each of the analyses. When appropriate to the method, method blank results have been reported with each analytical test.

Sample Receipt

Thirty-seven water samples were received for analysis at Columbia Analytical Services on 3/16/12. The samples were received in good condition and consistent with the accompanying chain of custody form. The samples were stored in a refrigerator at 4°C upon receipt at the laboratory.

General Chemistry Parameters

No anomalies associated with the analysis of these samples were observed.

Approved by Howard Holmes **Date** 4-1-12

Results flagged with an asterisk (*) indicate values outside control criteria.

Results flagged with a pound (#) indicate the control criteria is not applicable.

Percent recoveries and relative percent differences (RPD) are determined by the software using values in the calculation which have not been rounded.

COLUMBIA ANALYTICAL SERVICES, INC.

Client:	Battelle	**Service Request No.:**	K1202512
Project:	ENVVEST March 2012 (AMB10)	**Date Received:**	3/20/12
Sample Matrix:	Water		

CASE NARRATIVE

All analyses were performed consistent with the quality assurance program of Columbia Analytical Services, Inc. (CAS). This report contains analytical results for samples designated for Tier IV validation deliverables including summary forms and all of the associated raw data for each of the analyses. When appropriate to the method, method blank results have been reported with each analytical test.

Sample Receipt

Six water samples were received for analysis at Columbia Analytical Services on 3/20/12. The samples were received in good condition and consistent with the accompanying chain of custody form. The samples were stored in a refrigerator at 4°C upon receipt at the laboratory.

General Chemistry Parameters

No anomalies associated with the analysis of these samples were observed.

Approved by Howard Holmes **Date** 4-4-12

Sample Name:	AMB10-200 SN05	**Units:**	mg/L
Lab Code:	K1202512-001	**Basis:**	NA

Analyte Name	Analysis Method	MRL	MDL	Sample Result	Duplicate Sample K1202512-001DUP3 Result	Average	RPD	RPD Limit
Nitrogen, Total Kjeldahl (TKN)	351.4	1.0	0.4	1.1	1.1	1.10	8	20

Results flagged with an asterisk (*) indicate values outside control criteria.

Results flagged with a pound (#) indicate the control criteria is not applicable.

Percent recoveries and relative percent differences (RPD) are determined by the software using values in the calculation which have not been rounded.

LOG-IN CHECKLIST

Reference SOP# MSL-A-001

Central File #: 3106 Sample No(s): 810-861 Batch: 24

Project Name: AMB10 Day 1 Project Manager: JMM

TO BE COMPLETED BY PROJECT MANAGER (prior to arrival when possible)

Matrix: seawater WP#

Yes	No	
	✓	Navy-type Project (requires high-level sample tracking procedures)
	✓	USDA Samples (see Compliance Agreement Checklist)

PM Verification:

✓		Filter Samples:	Amount: Entire sample / Half of sample
	✓	Freeze dry sample(s) - samples will be weighed and placed in ultralow temp freezer (Login Lab)	
✓		Special instructions:	2 bottles for TSS - PNNL Nutrients and O&G to CAS

Sample Preservation Instructions: Filter metals

See LIMS for archive/disposal information

TO BE COMPLETED UPON SAMPLE ARRIVAL/LOG-IN

Yes	No	N/A	Indicate in Appropriate Box	
		✓	Custody seal present	Seal intact? YES NO
✓			Cooler temperature (acceptable range: 4±2°C or solids:frozen) (if multiple coolers, note temp. of each)	8 cooler all 4±2 °C ____ °C
		✓	Project Manager notified of any custody/login discrepancies (cooler temp, sponsor codes, etc)	Comment/Remedy:
✓			Were all chain of custody forms signed and dated?	
✓			Were samples filtered at MSL?	

Sample condition(s): (Acceptable) Other (explain):

Container type: (Teflon) (Poly) (Glass) Cap. Vial Other:

Notes:

Completed By: JMM Date/Time: 3/13/12 1935

SAMPLE PRESERVATION

		Sample(s) were preserved prior to arrival at MSL (noted on CoC / Sample / per PM Instruction)	
		Random pH checked for ~10% of samples (use dip paper)	Sample IDs:
		Complete pH check required for project (use pH meter and record on pH Record form)	
✓		Sample(s) were preserved at MSL	
Type:	✓	0.2% HNO3	Notes: Metals Optima Lot# 121020
		0.5% HCl (Hg samples)	Notes: Lot#
		Refrigerate/Freeze	Notes: TSS/OSAL
		Other	Notes:

Completed By: Date/Time: 3/14/12 16:30

Storage Shelf: L2C ~~L2B~~ L2A L1A

3/13/12 ~~3/14/12~~

LOG-IN CHECKLIST

Reference SOP# MSL-A-001

Central File #: 3104 Sample No(s): 862-891 Batch: 25

Project Name: ENVVEST AMB10 Project Manager: JMB

TO BE COMPLETED BY PROJECT MANAGER (prior to arrival when possible)

Matrix: _____ WP# _____

Yes	No	
☐	☐	Navy-type Project (requires high-level sample tracking procedures)
☐	☐	USDA Samples (see Compliance Agreement Checklist)

PM Verification:

☐	☐	Filter Samples: Amount: Entire sample Half of sample
☐	☐	Freeze dry sample(s) - samples will be weighed and placed in ultralow temp freezer (Login Lab)
☐	☐	Special instructions:

Sample Preservation Instructions: _____

See LIMS for archive/disposal information

TO BE COMPLETED UPON SAMPLE ARRIVAL/LOG-IN

hand delivered from field

Yes	No	N/A	Indicate in Appropriate Box
☐	☑	☐	Custody seal present Seal intact? YES NO
☐	☐	☑	Cooler temperature (acceptable range: 4±2°C or solids:frozen) (if multiple coolers, note temp. of each) >4°C °C / °C
☐	☐	☑	Project Manager notified of any custody/login discrepancies (cooler temp, sponsor codes, etc) Comment/Remedy:
☑	☐	☐	Were all chain of custody forms signed and dated?
☑	☐	☐	Were samples filtered at MSL? as noted on COC

Sample condition(s): Acceptable Other (explain):

Container type: Teflon Poly Glass Cap. Vial Other:

Notes: _____

Completed By: _____ Date/Time: 3/14/12 1630

SAMPLE PRESERVATION

☐		Sample(s) were preserved prior to arrival at MSL (noted on CoC / Sample / per PM Instruction)	
☐		Random pH checked for ~10% of samples (use dip paper)	Sample IDs:
☐		Complete pH check required for project (use pH meter and record on pH Record form)	
☒		Sample(s) were preserved at MSL	
Type:	☒	0.2% HNO3	Notes: Metals Lot# 121020
	☐	0.5% HCl (Hg samples)	Notes: Lot#
	☐	Refrigerate/Freeze	Notes: TSS TOC/DOC
	☐	Other	Notes:

Completed By: _____ Date/Time: 3/15/12 17:00

Storage Shelf: L-6-C, L-6-D

Central File #: 3106 Sample No(s): 892 - 905 Batch: 24

Project Name: AMB10 ENVVEST Project Manager: JMB

TO BE COMPLETED BY PROJECT MANAGER (prior to arrival when possible)

Matrix: _____ WP# _____

Yes	No		
☐	☐	Navy-type Project (requires high-level sample tracking procedures)	
☐	☐	USDA Samples (see Compliance Agreement Checklist)	PM Verification:
☐	☐	Filter Samples: *Amount:* Entire sample Half of sample	
☐	☐	Freeze dry sample(s) - samples will be weighed and placed in ultralow temp freezer (Login Lab)	
☐	☐	Special instructions:	

Sample Preservation Instructions: _____

See LIMS for archive/disposal information

TO BE COMPLETED UPON SAMPLE ARRIVAL/LOG-IN

Hand delivered

Yes	No	N/A	Indicate in Appropriate Box	
☐	☐	☑	Custody seal present	Seal intact? YES NO
☑	☐	☐	Cooler temperature (acceptable range: 4±2°C or solids:frozen) (if multiple coolers, note temp. of each)	>4 degrees C °C _____ °C
☐	☐	☑	Project Manager notified of any custody/login discrepancies (cooler temp, sponsor codes, etc) Comment/Remedy:	
☑	☐	☐	Were all chain of custody forms signed and dated?	
☑	☐	☐	Were samples filtered at MSL? as noted	

Sample condition(s): ~~Acceptable~~ ~~Other (explain):~~

Container type: ~~Teflon~~ Poly ~~Glass~~ ~~Cap. Vial~~ Other: _____

Notes: _____

Completed By: _____ Date/Time: 3/16/12 1730

SAMPLE PRESERVATION

☐ Sample(s) were preserved prior to arrival at MSL (noted on CoC / Sample / per PM Instruction)

☐ Random pH checked for ~10% of samples (use dip paper) Sample IDs: _____

☐ Complete pH check required for project (use pH meter and record on pH Record form)

☐ Sample(s) were preserved at MSL

Type: ☐	0.2% HNO3	Notes:	Lot# 1211020
☐	0.5% HCl (Hg samples)	Notes:	Lot#
☑	Refrigerate/Freeze	Notes: TSS TOC/DOC	
☐	Other	Notes:	

Completed By: _____ Date/Time: _____

1. Samples were received via? *Mail* *(Fed Ex)* *UPS* *DHL* *PDX* *Courier* *Hand Delivered*
2. Samples were received in: (circle) *(Cooler)* *Box* *Envelope* *Other* _____ *NA*
3. Were custody seals on coolers? NA (Y) N If yes, how many and where? 1 front
   If present, were custody seals intact? (Y) N If present, were they signed and dated? (Y) N

Cooler Temp °C	Temp Blank °C	Thermometer ID	Cooler/COC ID (NA)	Tracking Number	NA	Filed
1.8	n/a	308				X
0.8	n/a	276				X
2.8	n/a	274				X

7. Packing material: *Inserts* *Baggies* *Bubble Wrap* *Gel Packs* *Wet Ice* *Dry Ice* *Sleeves* paper
8. Were custody papers properly filled out (ink, signed, etc.)? NA (Y) N
9. Did all bottles arrive in good condition (unbroken)? *Indicate in the table below.* NA (Y) N
10. Were all sample labels complete (i.e analysis, preservation, etc.)? NA (Y) N
11. Did all sample labels and tags agree with custody papers? *Indicate major discrepancies in the table on page 2.* NA (Y) N
12. Were appropriate bottles/containers and volumes received for the tests indicated? NA (Y) N
13. Were the pH-preserved bottles (*see SMO GEN SOP*) received at the appropriate pH? *Indicate in the table below* ~~NA~~ BT 3/16/12 (Y) N
14. Were VOA vials received without headspace? *Indicate in the table below.* ~~NA~~ Y N
15. Was C12/Res negative? ~~NA~~ Y N

Sample ID on Bottle	Sample ID on COC	Identified by:

Sample ID	Bottle Count Bottle Type	Out of Temp	Head-space	Broke	pH	Reagent	Volume added	Reagent Lot Number	Initials	Time

Notes, Discrepancies, & Resolutions: For samples AMB10DS-002, 003 DOC marked on COC but rec'd Btls for O&G

Metals in Water

DATA QUALIFIERS:

c	Exceeds DQO but meets contingency criteria of either:
1	SRM certified <10x MDL
2	Insufficient spiking level relative to native sample concentrations
3	Sample concentration <10x MDL
U	Analyte not detected at or above the MDL, MDL reported
J	Analyte detected above the MDL, but less than the RL
--	Not analyzed
NA	Not applicable/available
N	Spiked sample recovery outside QC criterion of 70-130%
NC	Not Certified
&	Accuracy result outside QC criterion of ≤20% PD
*	Precision result outside QC criterion of <30%
NS	Sample not spiked for this analyte
B	Analyte detected in the method blank > RL and sample concentration < 10 times detected blank value
b	Data are blank corrected using the batch specific procedural blank
[1]	Reported from the nucleopore filtration method instead of GF/C filters
[2]	Seawater DOC CRM (LOT#03-12) and low carbon water (LCW) were purchased from University of Miami http://yyy.rsmas.miami.edu/groups/biogeochem/CRM.html
HTCO	High Temperature Catalytic Oxidation
E	Small crack in sample bottle; use with caution

PROJECT: Sinclair and Dyes Inlet Ambient Monitoring, August 2012 (AMB11)

PARAMETER: Total and Dissolved Metals – Al, Ag, As (Total only), Cd, Cr, Cu, Pb, Zn, Hg
Total Suspended Solids (TSS), Salinity (OSAL), Dissolved Organic Carbon (DOC), and Total Organic Carbon (TOC)

LABORATORY: Battelle Marine Sciences Laboratory (MSL), Sequim, Washington

MATRIX: Seawater, Freshwater

SAMPLE CUSTODY AND PROCESSING: Samples were collected from Sinclair and Dyes Inlet region by MSL and the U.S. Navy on 08/28/12 and 08/29/12. Samples were hand delivered to MSL by the field team. All samples were received in good condition. Samples were assigned a Battelle Central File (CF) identification number (3106) and were entered into Battelle's sample tracking system. Upon receipt at MSL, the samples designated for total and dissolved metals (TME/DME) were shaken vigorously and approximately 500mL was filtered through a pre-cleaned 0.45µm polyvinylidene fluoride (PVDF) filter membrane inside a class 100 clean bench and the filtrate was transferred to a trace metal clean Teflon bottle. The dissolved and total fractions were each acidified to a pH of < 2.0 with double distilled nitric acid. The samples for TSS and OSAL were stored at 4.0±2°C in low density polyethylene bottles prior to analysis. The samples for TOC and DOC were collected in pre-cleaned glass and stored at -20°C until analyses. No TOC was collected for sample 3106*934.

The following lists information on sample receipt and processing activities:

Sample Receipt Dates:	08/28/12 and 08/29/12
Cooler temp. on arrival	All coolers were at 4.0±2°C
Collection dates	08/28/12 and 08/29/12
TSS analysis dates	08/30/12 through 09/07/12
OSAL analysis dates	08/30/12 and 09/04/12
CVAF analysis dates (Hg)	09/11/12, 09/13/12, 09/14/12, 09/21/12, and 09/24/12
TRM Prep/Freshwater Analysis by ICP-MS (Ag, Al, Cd, Cr, Cu, Ni, Pb, Zn)	09/10/12
Fe/Pd Preconcentration Seawater Analysis by ICP-MS (Ag, Al, Cd, Cr, Cu, Ni, Pb, Zn)	09/05/12, 09/07/12, and 09/21/12
FIAS analysis date (As)	09/20/12
TOC/DOC Analysis Date	10/3-10/5/12; 10/8-9/12

METHODS:

Seawater samples were analyzed for ten metals: aluminum (Al), arsenic (As), cadmium (Cd), chromium (Cr), copper (Cu), nickel (Ni), lead (Pb), silver (Ag), zinc (Zn), and mercury (Hg). Samples were submitted for analyses following three methods. The analyses of As and Hg do not require a salt removal technique prior to analyses, therefore, the data are not reported as reagent blank corrected (identified as a "b" qualifier) for these elements. All samples were analyzed for Hg by Cold Vapor Atomic Fluorescence (CVAF) in accordance with Battelle SOP *MSL-I-013*, *Total Mercury in Aqueous Samples by CVAF*, following EPA Method 1631 revision E. The samples for total metals (TME) were analyzed for As by Flow-Injection Atomic Spectroscopy (FIAS) in accordance with Battelle SOP *MSL-I-030, Determination of Metals in Aqueous and Digestate Samples by Hydride Generation Atomic Absorption*

METHODS (cont): *(HGAA) with Flow Injection (FIAS).* The base method for this procedure is EPA Method 270.3.

Prior to analyses of all other metals, seawater samples were preconcentrated via a precipitation step followed by reconstituted in a salt free solution in accordance with Battelle SOP *MSL-I-025, Methods of Sample Preconcentration: Iron and Palladium/APDC Coprecipitation and Borohydride Reductive Precipitation for Trace Metals Analysis in Water*. Preconcentrated seawater samples were analyzed for Al (total only), Ag, Cd, Cr, Cu, Pb and Zn by Inductively Coupled Plasma-Mass Spectrometry (ICP-MS) in accordance with Battelle SOP *MSL-I-022, Determination of Elements in Aqueous and Digestate Samples by ICP/MS.* The base methods for this procedure are EPA Method 1638 and EPA Method 1640. Freshwater samples were digested using the total metal recoverable (TRM) method established in EPA Method 1640 prior to analysis by ICP-MS following SOP MSL-I-022.

All metal results were reported in units of µg/L. Data are reported as blank corrected for the metals requiring Fe/Pd preconcentration (Al, Ag, Cd, Cr, Cu, Ni, Pb, and Zn) and denoted with a b-flag. The required preconcentration procedure for ICP-MS analyses includes the addition of chelating agents to induce precipitation of metals under specific conditions. Subsequently, reagents added to the samples should be of the purest quality to result in zero addition of metals to the seawater samples. Required reagents have trace impurities of these metals; therefore, the data are blank corrected for these elements. Results were corrected using the mean batch reagent blank identified for each preparation batch as BMRB_analysis date and provided in the table identified as the QC Results for ICP-MS.

Freshwater samples identified as < 5% seawater were analyzed as follows. Freshwater samples were analyzed for Hg and As as described above for the seawater. These methods are not selective to salt content and are the same for both the seawater and freshwater matrices. The other metals were determined by ICP-MS following the preparation method for total recoverable metals (TRM) described in EPA Method 1640 followed by analyses by ICP-MS.

The TSS samples were analyzed following SM2540Dmod using a gravimetric analysis. The modification occurs in the type of filter. This is the first batch of AMB samples where the 0.45 µm polycarbonate filters were used. A comparison between the glass fiber filters (GF/C) and the polycarbonate was conducted on AMB10 and AMB11. In almost all cases the GF/C filters over estimated the TSS concentration. The SOP has been modified to reflect the changes in the type of filter used for isolation of the TSS. No other changes were made to the standard method protocol. The data are reported in units of mg/L. The OSAL samples were measured using a YSI-30 S-C-T probe. The data are reported in practical salinity units (PSU).

The TOC and DOC samples were analyzed using a High Temperature Catalytic Oxidation (HTCO) method. The instrument is specially equipped with high-salt sample combustion tube kit and halogen scrubber for seawater analysis. Seawater samples were acidified to pH <2 by concentrated hydrochloric acid (trace metal grade, Fisher Chemical) prior to analysis then sparged for 2 min to remove inorganic carbon (IC). The non-purgeable organic carbons (NPOC) in samples were further converted to CO_2 by oxidation at 680°C with a platinum catalyst. A non-dispersive infrared detector (NDIR) was used to detect the converted CO_2 for quantification of NPOC. The data are reported as both mg/L and µM.

HOLDING TIMES: All samples were analyzed within the established holding times of 90 days for Hg, six months for all other metals, and 7 days between collection and filtration for TSS.

DETECTION LIMITS: Laboratory method detection limits (MDLs) for seawater are reported from the Annually Verified Seawater MDL Study as determined by seven replicates of Sequim Bay Seawater spiked at an appropriate concentration for each analyte. The freshwater MDL was reported from the Annually Verified Freshwater MDL Study determined using seven replicates of deionized water prepared using the TRM preparation. Reporting limits are determined as 3.18 times the laboratory achieved MDL. The data are evaluated and flagged as follows:

U Analyte not detected at or above the MDL, MDL reported
J Analyte detected above the MDL, but less than the RL
N Spiked sample recovery outside QC criterion of 70-130%
& Accuracy result outside QC criterion of ≤20% PD
* Precision result outside QC criterion of <30%
B Analyte detected in the method blank > RL and sample concentration < 10 times detected blank value
c Exceeds data quality objective but meets contingency criterion
b Result is reagent blank corrected using the batch specific blank (BMRB)

METHOD BLANKS: A minimum of three method blanks were analyzed by each instrument with each analytical batch for metals. The average method blank for each batch was less than the RL for all metals except Zn. The seawater preconcentration procedure required to remove salt interferences prior to ICP-MS analysis includes the addition of chelating agents to induce precipitation of metals under specific conditions as discussed in the method section above. The data were evaluated and qualified with a "B" if the sample concentration was less than ten times the mean detected blank detected above the RL for the analytical batch. The reagent blank correction takes into consideration the detected blank for each batch and the data should be reported as corrected in order to more accurately represent the true sample concentrations. The data were not considered impacted by the detected Zn blanks, however, they were flagged in accordance with the procedure above.

The method blank for TSS is a polycarbonate filter (Nucleopore) taken through the analytical process with each batch of samples. The blanks were all less than the MDL. The method blanks for TOC and DOC were low carbon water (LCW) purchased from University of Miami. This water was analyzed as part of the HTCO calibration curve to demonstrate that the instrumentation was not contributing carbon.

LABORATORY CONTROL SAMPLES: A minimum of one LCS (OPR or blank spike) was prepared and analyzed with each analytical batch of 20 or fewer samples for metals. Percent recoveries for LCS samples were within the QC acceptance criterion of 70% to 130% for all metals. The LCS matrix for the seawater samples was Sequim Bay Seawater prepared as both spiked and unspiked samples.

MATRIX SPIKE ACCURACY: A minimum of one set of duplicate matrix spikes (MS/MSD) was prepared and analyzed with each analytical batch of 20 or fewer samples for metals. Percent recoveries for matrix spikes were within the QC limits of 70% to 130% for all metals spiked at an appropriate level relative to the native sample concentration. The Al MS/MSD samples spiked at 1 µg/L were not reported because the spiking level is below the RL. The MS/MSD samples spiked at 5 µg/L demonstrated acceptable recovery for Al.

REPLICATE PRECISION: Laboratory precision was expressed as the relative percent difference (RPD) between laboratory duplicates. The RPD values for the laboratory duplicates were within the QC acceptance criterion of ±30% for all metals detected above the RL. The highest RPD was 19% and demonstrated good analytical precision for all the metals and TOC/DOC.

STANDARD REFERENCE MATERIAL ACCURACY:

Standard reference materials (SRM) were prepared and analyzed with each analytical batch at a minimum frequency of 1 per 20 or fewer samples. Analytical accuracy was expressed as the percent difference (PD) between the measured and the certified value. The SRM for Hg was 1641d, a freshwater SRM, as no seawater SRM was available. The percent recoveries were within the QC acceptance criterion of 80-120%. The SRM for As was the coastal ocean SRM CASS-5. The percent recoveries were within the QC acceptance criterion.

Three different SRMs were analyzed with the analytical batches for Al, Ag, Cd, Cr, Cu, Ni, Pb, and Zn quantified by ICP-MS. The freshwater SRM 1640a demonstrated analytical accuracy for each batch analyzed by ICP-MS and the freshwater sample matrices (e.g. outfall 021). Percent recoveries were within the QC acceptance criterion. There are no seawater SRMs certified for Ag or Al. High purity standards and the freshwater SRM were used to evaluate analytical accuracy.

Two seawater SRMs were analyzed with each batch. The primary SRM was the coastal SRM CASS-5 and the secondary was the estuarine SRM SLEW-3. Both were prepared with each batch of preconcentrated samples. The PDs were within the QC criterion for all metals certified greater than 10x the MDL except two replicates for Cd (21% and 22%) and two for Zn (21% and 28%). The certified value for Cd is less than the RL, therefore, SLEW-3 was used to demonstrate acceptable accuracy for Cd. All replicates of Pb and Zn for SLEW-3 were flagged as certified less than 10x the MDL and not appropriate for data quality evaluation. The SRMs CASS-5, seawater LCS, MS/MSD, and freshwater SRM 1640a demonstrated acceptable accuracy for Pb and Zn.

The SRM Copenhagen Water was used to verify the accuracy of the salinity measurements. The accuracy was 0.3-0.8% PD for all salinity measurements. There are no SRMs available for TOC or DOC. University of Miami provides a laboratory consensus value for DOC in estuarine water http://yyy.rsmas.miami.edu/groups/biogeochem/CRM.html The average of the reference value range was used to calculate the PD for each replicate. The PD ranged from 1.5-13%.

ALS ENVIRONMENTAL

Client:	Battelle	**Service Request No.:**	K1208602
Project:	ENVVEST August 2012 (AMB11)	**Date Received:**	8/30/12
Sample Matrix:	Water		

CASE NARRATIVE

All analyses were performed consistent with the quality assurance program of ALS Environmental. This report contains analytical results for samples designated for Tier IV validation deliverables including summary forms and all of the associated raw data for each of the analyses. When appropriate to the method, method blank results have been reported with each analytical test.

Sample Receipt

Three water samples were received for analysis at ALS Environmental on 8/30/12. The samples were received in good condition and consistent with the accompanying chain of custody form. The samples were stored in a refrigerator at 4°C/frozen at –20°C upon receipt at the laboratory.

Sample Note:
Sample AMB11DD-002/OF019 was accidently broken while being put away into cold storage.
Client was notified by email on 8/30/12. No back up sample was available.

General Chemistry Parameters

Total Oil and Grease by EPA Method 1664A:
The matrix spike recovery of Total Oil and Grease for sample Batch QC was outside control criteria because of suspected matrix interference. Recovery in the Laboratory Control Sample (LCS) was acceptable, which indicated the analytical batch was in control. No further corrective action was taken.

No other anomalies associated with the analysis of these samples were observed.

Ammonia as Nitrogen

Sample Name:	AMB11-024/PS12	**Units:**	mg/L
Lab Code:	K1208667-021	**Basis:**	NA
Analysis Method:	350.1		

		Matrix Spike K1208667-021MS4			Duplicate Matrix Spike K1208667-021DMS4					
Analyte Name	**Sample Result**	**Result**	**Spike Amount**	**% Rec**	**Result**	**Spike Amount**	**% Rec**	**% Rec Limits**	**RPD**	**RPD Limit**
Ammonia as Nitrogen	0.018	0.228	0.200	105	0.232	0.200	107	90-110	1	20

Results flagged with an asterisk (*) indicate values outside control criteria.

Results flagged with a pound (#) indicate the control criteria is not applicable.

Percent recoveries and relative percent differences (RPD) are determined by the software using values in the calculation which have not been rounded.

Results flagged with an asterisk (*) indicate values outside control criteria.

Results flagged with a pound (#) indicate the control criteria is not applicable.

Percent recoveries and relative percent differences (RPD) are determined by the software using values in the calculation which have not been rounded.

Results flagged with an asterisk (*) indicate values outside control criteria.

Results flagged with a pound (#) indicate the control criteria is not applicable.

Percent recoveries and relative percent differences (RPD) are determined by the software using values in the calculation which have not been rounded.

LOG-IN CHECKLIST

Reference SOP# MSL-A-001

Central File #: 3106 Sample No(s): 908-963 Batch: AMB11-DAP1 (27)

Project Name: AmB11 Project Manager: JMG

TO BE COMPLETED BY PROJECT MANAGER (prior to arrival when possible)

Matrix: seawater / high water WP# _____

Yes	No	
☐	☑	Navy-type Project (requires high-level sample tracking procedures)
☐	☑	USDA Samples (see Compliance Agreement Checklist)

PM Verification:

☑	☐	Filter Samples:	Amount: Entire sample Half of sample
☐	☑	Freeze dry sample(s) - samples will be weighed and placed in ultralow temp freezer (Login Lab)	
☑	☐	Special instructions:	ship nutrients & oil and grease to CAS

Sample Preservation Instructions: see QAPP

See LIMS for archive/disposal information

TO BE COMPLETED UPON SAMPLE ARRIVAL/LOG-IN

Yes	No	N/A	Indicate in Appropriate Box
☐	☐	☑	Custody seal present Seal intact? YES NO
☑	☐	☐	Cooler temperature (acceptable range: 4±2°C or solids:frozen) coolers all 4±2 °C
			(if multiple coolers, note temp. of each) _____ °C
☐	☐	☑	Project Manager notified of any custody/login discrepancies (cooler temp, sponsor codes, etc)
			Comment/Remedy: _____
☑	☐	☐	Were all chain of custody forms signed and dated?
☑	☐	☐	Were samples filtered at MSL?

Sample condition(s): Acceptable Other (explain):

Container type: Teflon Poly Glass Cap. Vial Other:

Notes: Coolers stored in cold room until filtering 8/29/12 JG

Completed By: _____ Date/Time: 8/28/12 1700

D:6 to CAS 8/29/12 JG

Fax to 1-888-321-2850

SAMPLE PRESERVATION

☐	Sample(s) were preserved prior to arrival at MSL (noted on CoC / Sample / per PM Instruction)			
☐	Random pH checked for ~10% of samples (use dip paper)	Sample IDs:		
☐	Complete pH check required for project (use pH meter and record on pH Record form)			
☐	Sample(s) were preserved at MSL			
Type: ☑	0.2% HNO3 Metals	Notes:		Lot#
☐	0.5% HCl (Hg samples)	Notes:		Lot#
☑	Refrigerate/Freeze TOC/DOC	Notes:		
☐	Other TSS/SPM	Notes:		

Completed By: C. Sullivan Date/Time: 8/30/12 by KPL (acid to meters)

Storage Shelf: UoD:C (mat) JG

LOG-IN CHECKLIST

Reference SOP# MSL-A-001

Central File #: 3106 Sample No(s): 944-1005 Batch: 28

Project Name: AMB 11 Day 2 Project Manager: JMG

TO BE COMPLETED BY PROJECT MANAGER (prior to arrival when possible)

Matrix: seawater WP#

Yes	No	
	✓	Navy-type Project (requires high-level sample tracking procedures)
	✓	USDA Samples (see Compliance Agreement Checklist)

PM Verification:

✓		Filter Samples: Amount: Entire sample (Half of sample)
	✓	Freeze dry sample(s) - samples will be weighed and placed in ultralow temp freezer (Login Lab)
✓		Special instructions: ship nutrients to CAS

Sample Preservation Instructions: freeze DOC/TDC & refrig metals/TSS

See LIMS for archive/disposal information

TO BE COMPLETED UPON SAMPLE ARRIVAL/LOG-IN

Yes	No	N/A	Indicate in Appropriate Box
		✓	Custody seal present Seal intact? YES NO
✓			Cooler temperature (acceptable range: 4±2°C or solids:frozen) (if multiple coolers, note temp. of each) 5 cooler °C cell 4±2°C
		✓	Project Manager notified of any custody/login discrepancies (cooler temp, sponsor codes, etc) Comment/Remedy:
✓			Were all chain of custody forms signed and dated?
✓			Were samples filtered at MSL?

Sample condition(s): (Acceptable) Other (explain):

Container type: (Teflon) (Poly) (Glass) Cap. Vial Other:

Notes:

Completed By: Date/Time: 8/29/12 1730

SAMPLE PRESERVATION

		Sample(s) were preserved prior to arrival at MSL (noted on CoC / Sample / per PM Instruction)		
		Random pH checked for ~10% of samples (use dip paper)	Sample IDs:	
		Complete pH check required for project (use pH meter and record on pH Record form)		
✓		Sample(s) were preserved at MSL		
Type:	✓	0.2% HNO3 Metals	Notes:	Lot#
		0.5% HCl (Hg samples)	Notes:	Lot#
	✓	Refrigerate/Freeze (TSS OSPW) (TOC DOC)	Notes:	
		Other	Notes:	

Completed By: Date/Time: 8/30/12 KJL to preserve Metals

Storage Shelf: Metals = Prep Lab

Cooler Receipt and Preservation Form

Client / Project: Battelle Service Request K12 8d67

Received: 8/31/12 Opened: 8/31/12 By: XO Unloaded: 8/31/12 By: XO

1. Samples were received via? *Mail* (*Fed Ex*) *UPS* *DHL* *PDX* *Courier* *Hand Delivered*
2. Samples were received in: (circle) (*Cooler*) *Box* *Envelope* *Other*_____ *NA*
3. Were custody seals on coolers? NA Y (N) If yes, how many and where?_____
   If present, were custody seals intact? Y N If present, were they signed and dated? Y N

Cooler Temp °C	Temp Blank °C	Thermometer ID	Cooler/COC ID NA	Tracking Number NA	Filed
1.6		302		7988 6607 9383	
-.2		274		7988 6607 8994	
-.3		208		~~7988 6607 8~~ 7988 6607 8836	
.1		295		7988 6607 9203	

7. Packing material: *Inserts* *Baggies* (*Bubble Wrap*) (*Gel Packs*) *Wet Ice* *Dry Ice* *Sleeves* hard pack ice
8. Were custody papers properly filled out (ink, signed, etc.)? NA (Y) N
9. Did all bottles arrive in good condition (unbroken)? *Indicate in the table below.* NA (Y) N
10. Were all sample labels complete (i.e analysis, preservation, etc.)? NA (Y) N
11. Did all sample labels and tags agree with custody papers? *Indicate major discrepancies in the table on page 2.* NA (Y) N
12. Were appropriate bottles/containers and volumes received for the tests indicated? NA (Y) N
13. Were the pH-preserved bottles (*see SMO GEN SOP*) received at the appropriate pH? *Indicate in the table below* NA (Y) N
14. Were VOA vials received without headspace? *Indicate in the table below.* (NA) Y N
15. Was C12/Res negative? (NA) Y N

Sample ID on Bottle	Sample ID on COC	Identified by:

Sample ID	Bottle Count Bottle Type	Out of Temp	Head-space	Broke	pH	Reagent	Volume added	Reagent Lot Number	Initials	Time

*Notes, Discrepancies, & Resolutions:*_____

Analytical Chemistry Data Package

Project: ENVVEST Ambient Monitoring February 2013 (AMB12), CuTox, and Mussel Watch

Seawater and Freshwater Chemistry

Battelle Project No. 54220
CF No. 3106, 3318, 3356

Marine Sciences Laboratory
1529 West Sequim Bay Road
Sequim, WA 98382
PM: Jill Brandenberger
(360) 681-4564

CHEMISTRY ANALYSIS
DATA PACKAGE CONTENT

Ambient Monitoring - AMB12, CuTox, and Mussel Watch
ENVVEST February 2013
Metals in Water

DATA QUALIFIERS:

c	Exceeds DQO but meets contingency criteria of either:
1	SRM certified <10x MDL
2	Insufficient spiking level relative to native sample concentrations
3	Sample concentration <10x MDL
U	Analyte not detected at or above the MDL, MDL reported
J	Analyte detected above the MDL, but less than the RL
--	Not analyzed
NA	Not applicable/available
N	Spiked sample recovery outside QC criterion of 70-130%
NC	Not Certified
&	Accuracy result outside QC criterion of ≤20% PD
*	Precision result outside QC criterion of <30%
NS	Sample not spiked for this analyte
B	Analyte detected in the method blank > RL and sample concentration < 10 times detected blank value
b	Data are blank corrected using the batch specific procedural blank
[1]	Reported from the nucleopore filtration method instead of GF/C filters
[2]	Seawater DOC CRM (LOT#03-12) and low carbon water (LCW) were purchased from University of Miami http://yyy.rsmas.miami.edu/groups/biogeochem/CRM.html
HTCO	High Temperature Catalytic Oxidation
E	Small crack in sample bottle; use with caution

QA/QC NARRATIVE

PROJECT: Sinclair and Dyes Inlet Ambient Monitoring, February 2013 (AMB12)

PARAMETER: Total and Dissolved Metals – Al, Cu, Pb, Zn, Hg
Total Suspended Solids (TSS), Salinity (OSAL), Dissolved Organic Carbon (DOC), and Total Organic Carbon (TOC)

LABORATORY: Battelle Marine Sciences Laboratory (MSL), Sequim, Washington

MATRIX: Seawater, Freshwater

SAMPLE CUSTODY AND PROCESSING: Samples were collected from Sinclair and Dyes Inlet region by MSL and the U.S. Navy on 02/12/2013 and 02/13/2013. Samples were hand delivered to MSL by the field team. All samples were received in good condition. Samples were assigned a Battelle Central File (CF) identification number (3106) and were entered into Battelle's sample tracking system. Upon receipt at MSL, the samples designated for total and dissolved metals (TME/DME) were shaken vigorously and approximately 500mL was filtered through a pre-cleaned 0.45µm polyvinylidene fluoride (PVDF) filter membrane inside a class 100 clean bench and the filtrate was transferred to a trace metal clean Teflon bottle. The dissolved and total fractions were each acidified to a pH of < 2.0 with double distilled nitric acid. The samples for TSS and OSAL were stored at 4.0±2°C in low density polyethylene bottles prior to analysis. The samples for TOC and DOC were collected in pre-cleaned glass and stored at -20°C until analyses.

The following lists information on sample receipt and processing activities:

Sample Receipt Dates:	02/12/13 and 02/13/13 EQP BLKS 02/19/13
Cooler temp. on arrival	All coolers were at 4.0±2°C
Collection dates	02/12/13 and 02/13/13 EQP BLKS 02/19/13
TSS analysis dates	02/15/13 and 02/18/13
OSAL analysis dates	02/15/13 and 02/18/13
CVAF analysis dates (Hg)	02/21/13, 02/25/13, 02/26/13, 03/06/13, 03/07/13, and 03/20/13
TRM Prep/Freshwater Analysis by ICP-MS (Al, Cu, Pb, Zn)	02/28/13
Fe/Pd Preconcentration Seawater Analysis by ICP-MS (Al, Cu, Pb, Zn)	02/21/13, 03/05/13, 03/07/13, and 03/25/13
Cu-FIDRC Seawater Analysis by ICP-MS (Cu)	04/17/13
TOC/DOC Analysis Date	02/20/13 through 02/27/13

QA/QC NARRATIVE

QA/QC DATA QUALITY OBJECTIVES FOR SEAWATER SAMPLES:

Analyte	Analytical Method for Seawater	MS Range of Recovery	SRM Percent Difference	Replicate Precision	Method Detection Limits	Reporting Limits
TSS	SM2540D	NA	≤20%	NA	0.49 mg/L	0.49 mg/L
OSAL	Probe	NA	≤20%	≤30%	0.01 PSU	NA
TOC/DOC	HTCO	NA	≤20%	≤30%	0.030 mg/L	0.095 mg/L
Aluminum	ICP-MS	70-130%	≤20%	≤30%	2.14 µg/L	6.8 µg/L

Zinc	ICP-MS	70-130%	≤20%	≤30%	0.0263 µg/L	0.084 µg/L
Mercury	CVAF	70-130%	≤20%	≤30%	0.1 ng/L	0.32 ng/L

QA/QC DATA QUALITY OBJECTIVES FOR FRESHWATER SAMPLES:

Analyte	Analytical Method for Freshwater	MS Range of Recovery	SRM Percent Difference	Replicate Precision	Method Detection Limits	Reporting Limits
TSS	SM2540D	NA	≤20%	NA	0.49 mg/L	0.49 mg/L
TOC/DOC	HTCO	NA	≤20%	≤30%	0.030 mg/L	0.095 mg/L
Aluminum	ICP-MS	70-130%	≤20%	≤30%	0.2 µg/L	0.6 µg/L
Copper	ICP-MS	70-130%	≤20%	≤30%	0.0053 µg/L	0.017 µg/L
Lead	ICP-MS	70-130%	≤20%	≤30%	0.0022 µg/L	0.0070 µg/L
Zinc	ICP-MS	70-130%	≤20%	≤30%	0.02 µg/L	0.06 µg/L
Mercury	CVAF	70-130%	≤20%	≤30%	0.1 ng/L	0.32 ng/L

METHODS:

Seawater samples were analyzed for five metals: aluminum (Al), copper (Cu), lead (Pb), zinc (Zn), and mercury (Hg). Samples were submitted for analyses following three methods. The analyses of Hg does not require a salt removal technique prior to analyses, therefore, the data are not reported as reagent blank corrected (identified as a "b" qualifier) for these elements. All samples were analyzed for Hg by Cold Vapor Atomic Fluorescence (CVAF) in accordance with Battelle SOP *MSL-I-013*, *Total Mercury in Aqueous Samples by CVAF*, following EPA Method 1631 revision E. The Hg data are reported in ng/L

For the ambient monitoring samples for all other metals, seawater samples were preconcentrated via a precipitation step followed by reconstituted in a salt free solution in accordance with Battelle SOP *MSL-I-025, Methods of Sample Preconcentration: Iron and Palladium/APDC Coprecipitation and Borohydride (Fe/Pd) Reductive Precipitation for Trace Metals Analysis in Water.* Preconcentrated seawater samples were analyzed for Al (total only), Cu, Pb and Zn by Inductively Coupled Plasma-Mass Spectrometry (ICP-MS) in accordance with Battelle SOP *MSL-I-022, Determination of Elements in Aqueous and Digestate Samples by ICP/MS.* The base methods for this procedure are EPA Method 1638 and EPA Method 1640. Freshwater samples were digested using the total metal recoverable (TRM) method established in EPA Method 1640 prior to analysis by ICP-MS following SOP MSL-I-022.

METHODS (cont): The Fe/Pd preconcentrated results were reported in units of µg/L. Data were reagent blank corrected for the metals requiring Fe/Pd preconcentration (Al, Cu, Pb, and Zn) and denoted with a b-flag. The required preconcentration procedure for ICP-MS analyses includes the addition of chelating agents to induce precipitation of metals under specific conditions. Subsequently, reagents added to the samples should be of the purest quality to result in zero addition of metals to the seawater samples. Required reagents have trace impurities of these metals; therefore, the data are blank corrected for these elements. Results were corrected using the mean batch reagent blank identified for each preparation batch as BMRB_analysis date and provided in the table identified as the QC Results for ICP-MS.

The samples for the copper toxicity study were were analyzed for total and dissolved Cu following MSL SOP MSL-I-039, *Determination Of Copper In Seawater By On-Line Preconcentration And Flow Injection Inductively Coupled Plasma Mass Spectrometry*. Determination of Cu is performed by on-line preconcentration on a chelating resin, followed by injection into a flow system and detection by dynamic reaction chamber - inductively coupled plasma mass spectrometry (FI-ICP-MS). Instrumental calibration was conducted by an isotope dilution method (EPA Method 6800). The procedure is applicable to samples with a wide range in organic matter content since samples are pre-treated with an ultraviolet (UV) oxidation procedure prior to analyses. Reagent blank correction is not required for this method.

Freshwater samples identified as < 5% seawater were analyzed as follows. Freshwater samples were analyzed for Hg as described above for the seawater. This method is not selective to salt content and is the same for both the seawater and freshwater matrices. The other metals were determined by ICP-MS following the preparation method for total recoverable metals (TRM) described in EPA Method 1640 followed by analyses by ICP-MS.

The TSS samples were analyzed following SM2540Dmod using a gravimetric analysis. The modification occurs in the type of filter. This is the first batch of AMB samples where the 0.45 µm polycarbonate filters were used. A comparison between the glass fiber filters (GF/C) and the polycarbonate was conducted on AMB10 and AMB11. In almost all cases the GF/C filters over estimated the TSS concentration. The SOP has been modified to reflect the changes in the type of filter used for isolation of the TSS. No other changes were made to the standard method protocol. The data are reported in units of mg/L. The OSAL samples were measured using a YSI-30 S-C-T probe. The data are reported in practical salinity units (PSU).

The TOC and DOC samples were analyzed using a High Temperature Catalytic Oxidation (HTCO) method. The instrument is specially equipped with high-salt sample combustion tube kit and halogen scrubber for seawater analysis. Seawater samples were acidified to pH <2 by concentrated hydrochloric acid (trace metal grade, Fisher Chemical) prior to analysis then sparged for 2 minutes to remove inorganic carbon (IC). The non-purgeable organic carbons (NPOC) in samples were further converted to CO_2 by oxidation at 680°C with a platinum catalyst. A non-dispersive infrared detector (NDIR) was used to detect the converted CO_2 for quantification of NPOC. The data are reported as both mg/L and µM.

HOLDING TIMES: All samples were analyzed within the established holding times of 90 days for Hg, six months for all other metals, and 7 days between collection and filtration for TSS.

DETECTION LIMITS: Laboratory method detection limits (MDLs) for seawater are reported from the Annually Verified Seawater MDL Study as determined by seven replicates of Sequim Bay Seawater spiked at an appropriate concentration for each analyte. The freshwater MDL was reported from the Annually Verified Freshwater MDL Study determined

using seven replicates of deionized water prepared using the TRM preparation. Reporting limits are determined as 3.18 times the laboratory achieved MDL. The data are evaluated and flagged as follows:

U Analyte not detected at or above the MDL, MDL reported
J Analyte detected above the MDL, but less than the RL
N Spiked sample recovery outside QC criterion of 70-130%
& Accuracy result outside QC criterion of ≤20% PD
* Precision result outside QC criterion of <30%
B Analyte detected in the method blank > RL and sample concentration < 10 times detected blank value
c Exceeds data quality objective but meets contingency criterion
b Result is reagent blank corrected using the batch specific blank (BMRB)

METHOD BLANKS: A minimum of three method blanks were analyzed by each instrument with each analytical batch for metals except the Cu toxicity samples. The average method blank for each batch was less than the RL for all metals except several replicates for Zn. The seawater preconcentration procedure required to remove salt interferences prior to ICP-MS analysis includes the addition of chelating agents to induce precipitation of metals under specific conditions, as discussed in the method section above. The data were evaluated and qualified with a "B" if the sample concentration was less than ten times the mean detected blank detected above the RL for the analytical batch. The reagent blank correction takes into consideration the detected blank for each batch and the data should be reported as corrected in order to more accurately represent the true sample concentrations. The data were not considered impacted by the detected Zn blanks..

The method blank for the Cu toxicity study was less than the MDL and data are not reported as reagent blank corrected.

The method blank for TSS is a polycarbonate filter (Nucleopore) taken through the analytical process with each batch of samples. The blanks were all less than the MDL. The method blanks for TOC and DOC were low carbon water (LCW) purchased from University of Miami. This water was analyzed as part of the HTCO calibration curve to demonstrate that the instrumentation was not contributing carbon.

LABORATORY CONTROL SAMPLES: A minimum of one LCS (OPR or blank spike) was prepared and analyzed with each analytical batch of 20 or fewer samples for metals. Percent recoveries for LCS samples were within the QC acceptance criterion of 70% to 130% for all metals. The LCS matrix for the seawater samples was Sequim Bay Seawater prepared as both spiked and unspiked samples.

MATRIX SPIKE ACCURACY: A minimum of one set of duplicate matrix spikes (MS/MSD) was prepared and analyzed with each analytical batch of 20 or fewer samples for metals. Percent recoveries for matrix spikes were within the QC limits of 70% to 130% for all metals spiked at an appropriate level relative to the native sample concentration. The Al MS/MSD samples spiked at 1 µg/L were not reported because the spiking level is below the RL. The MS/MSD samples spiked at 5 µg/L demonstrated acceptable recovery for Al.

REPLICATE PRECISION: Laboratory precision was expressed as the relative percent difference (RPD) between laboratory duplicates. The RPD values for the laboratory duplicates were within the QC acceptance criterion of ±30% for all metals detected above the RL and for the TOC/DOC analyses.

STANDARD Standard reference materials (SRM) were prepared and analyzed with each analytical

REFERENCE MATERIAL ACCURACY:

batch at a minimum frequency of 1 per 20 or fewer samples. Analytical accuracy was expressed as the percent difference (PD) between the measured and the certified value. The SRM for Hg was 1641d, a freshwater SRM, as no seawater SRM was available. The percent recoveries were within the QC acceptance criterion of 80-120%. The percent recoveries were within the QC acceptance criterion.

Three different SRMs were analyzed with the analytical batches for Al, Cu, Pb, and Zn quantified by ICP-MS. The freshwater SRM 1640a demonstrated analytical accuracy for each batch analyzed by ICP-MS and the freshwater sample matrices (e.g. outfall 021). Percent recoveries were within the QC acceptance criterion. There are no seawater SRMs certified for Al. High purity standards and the freshwater SRM were used to evaluate analytical accuracy.

Two seawater SRMs were analyzed with each ICP-MS batch. The primary SRM was the coastal SRM CASS-5 and the secondary was the estuarine SRM SLEW-3. Both were prepared with each batch of preconcentrated samples and the Cu toxicity batch analyzed by FI-ICP-MS. The PDs were within the QC criterion for all metals certified greater than 10x the MDL.

The SRM Copenhagen Water was used to verify the accuracy of the salinity measurements. The accuracy was 0.3-0.8% PD for all salinity measurements. There are no SRMs available for TOC or DOC. University of Miami provides a laboratory consensus value for DOC in estuarine water http://yyy.rsmas.miami.edu/groups/biogeochem/CRM.html The average of the reference value range was used to calculate the PD for each replicate. The PD ranged from 0 to 13%.

ANALYTICAL NOTE

The two TOC samples for the mussel watch project were collected and preserved with sulfuric acid, which was consistent with the colormetric method previously used for TOC/DOC analyses. However, the new and more sensitive combustion method is not compatible with the sulfuric acid preservation. Therefore, no data are reported for these two samples.

ALS ENVIRONMENTAL

Client:	Battelle	**Service Request No.:**	K1301341
Project:	Feb 2013 AMB12	**Date Received:**	2/14/13
Sample Matrix:	Water		

Case Narrative

All analyses were performed consistent with the quality assurance program of ALS Environmental. This report contains analytical results for samples designated for Tier IV validation deliverables including summary forms and all of the associated raw data for each of the analyses. When appropriate to the method, method blank results have been reported with each analytical test.

Sample Receipt

One water sample was received for analysis at ALS Environmental on 2/14/13. The samples were received in good condition and consistent with the accompanying chain of custody form. The samples were stored in a refrigerator at 4°C upon receipt at the laboratory.

General Chemistry Parameters

No anomalies associated with the analysis of these samples were observed.

Nitrate+Nitrite as Nitrogen	0.377	2.40	2.00	101	2.37	2.00	100	89-114	1	20

Results flagged with an asterisk (*) indicate values outside control criteria.

Results flagged with a pound (#) indicate the control criteria is not applicable.

Percent recoveries and relative percent differences (RPD) are determined by the software using values in the calculation which have not been rounded.

LOG-IN CHECKLIST

Reference SOP# MSL-A-001

Central File #: 3106 Sample No(s): 1006 - 1053 Batch: 29

Project Name: AMB12 ENVVEST Project Manager: JMB

TO BE COMPLETED BY PROJECT MANAGER (prior to arrival when possible)

Matrix: seawater/freshwater WP#

Yes	No	
	✓	Navy-type Project (requires high-level sample tracking procedures)
	✓	USDA Samples (see Compliance Agreement Checklist)

PM Verification:

✓		Filter Samples:	Amount: Entire sample (Half of sample)
	✓	Freeze dry sample(s) - samples will be weighed and placed in ultralow temp freezer (Login Lab)	
✓		Special instructions:	oil & grease + nutrients to ALS

Sample Preservation Instructions: TOC/DOC freezer

See LIMS for archive/disposal information

TO BE COMPLETED UPON SAMPLE ARRIVAL/LOG-IN

Yes	No	N/A	Indicate in Appropriate Box
		✓	Custody seal present Seal intact? YES NO
✓			Cooler temperature (acceptable range: 4±2°C or solids:frozen) 7 cooler 4 ± 2 °C
			(if multiple coolers, note temp. of each) °C
		✓	Project Manager notified of any custody/login discrepancies (cooler temp, sponsor codes, etc)
			Comment/Remedy:
✓			Were all chain of custody forms signed and dated?
✓			Were samples filtered at MSL?

Sample condition(s): (Acceptable) Other (explain):

Container type: (Teflon) (Poly) (Glass) Cap. Vial Other:

Notes:

Completed By: JMB Date/Time: 2/12/13 1951

SAMPLE PRESERVATION

- [ ] Sample(s) were preserved prior to arrival at MSL (noted on CoC / Sample / per PM Instruction)
- [ ] Random pH checked for ~10% of samples (use dip paper) Sample IDs:
- [ ] Complete pH check required for project (use pH meter and record on pH Record form)
- [KC] Sample(s) were preserved at MSL

Type: [KC]	0.2% HNO3 - Metals	Notes: opt.	Lot# 121100
[ ]	0.5% HCl (Hg samples)	Notes:	Lot#
[ ]	(Refrigerate/Freeze) TSS/TOC/TOC	Notes: NA	
[ ]	Other 0.6 to CAS	Notes:	

Completed By: Date/Time: 2/13/13 18:00

Storage Shelf: 3106 1006 - 1025 - K3B ; 3106 1026 - 1045 - K6B remainder - KLC

LOG-IN CHECKLIST

Reference SOP# MSL-A-001

Central File #: 3106 Sample No(s): 1054 - 1093 Batch: 30

Project Name: AMB12 FNUUEST Day 2 Project Manager: JMM

TO BE COMPLETED BY PROJECT MANAGER (prior to arrival when possible)

Matrix: seawater WP# _____

Yes	No	
☐	☑	Navy-type Project (requires high-level sample tracking procedures)
☐	☑	USDA Samples (see Compliance Agreement Checklist)

PM Verification:

☑	☐	Filter Samples:	Amount: Entire sample / Half of sample
☐	☑	Freeze dry sample(s) - samples will be weighed and placed in ultralow temp freezer (Login Lab)	
☑	☐	Special instructions:	send nutrients to ALS; freeze DOC/TOC

Sample Preservation Instructions: metals 0.2% HNO_3 after filtration

See LIMS for archive/disposal information

TO BE COMPLETED UPON SAMPLE ARRIVAL/LOG-IN

Yes	No	N/A	Indicate in Appropriate Box
☐	☐	☑	Custody seal present — Seal intact? YES NO
☑	☐	☐	Cooler temperature (acceptable range: 4±2°C or solids:frozen) 5 coolers 4 ± 2 °C
			(if multiple coolers, note temp. of each) _____ °C
☐	☐	☑	Project Manager notified of any custody/login discrepancies (cooler temp, sponsor codes, etc)
			Comment/Remedy: _____
☑	☐	☐	Were all chain of custody forms signed and dated?
☑	☐	☐	Were samples filtered at MSL?

Sample condition(s): Acceptable / Other (explain):

Container type: Teflon / Poly / Glass Cap. Vial Other: _____

Notes: _____

Completed By: _____ Date/Time: 2/13/13 1700

SAMPLE PRESERVATION

☐		Sample(s) were preserved prior to arrival at MSL (noted on CoC / Sample / per PM Instruction)	
☐		Random pH checked for ~10% of samples (use dip paper)	Sample IDs: _____
☐		Complete pH check required for project (use pH meter and record on pH Record form)	
☑		Sample(s) were preserved at MSL	
Type:	☑	0.2% HNO_3	Notes: opt. Lot# 121100
	☐	0.5% HCl (Hg samples)	Notes: _____ Lot# _____
	☐	Refrigerate/Freeze TOC/DOC NUT/TSS	Notes: _____
	☐	Other	Notes: _____

Completed By: _____ Date/Time: 2/14/13 16:00

Storage Shelf: 1054 - 1065 - K6C 1066 - 1083 - K6D Others K5D

Metals in Water

DATA QUALIFIERS:

c	Exceeds DQO but meets contingency criteria of either:
1	SRM certified <10x MDL
2	Insufficient spiking level relative to native sample concentrations
3	Sample concentration <10x MDL
U	Analyte not detected at or above the MDL, MDL reported
J	Analyte detected above the MDL, but less than the RL
--	Not analyzed
NA	Not applicable/available
N	Spiked sample recovery outside QC criterion of 70-130%
NC	Not Certified
&	Accuracy result outside QC criterion of ≤20% PD
*	Precision result outside QC criterion of <30%
NS	Sample not spiked for this analyte
B	Analyte detected in the method blank > RL
	and sample concentration < 10 times detected blank value
b	Data are blank corrected using the batch specific procedural blank
[1]	Reported from the nucleopore filtration method instead of GF/C filters
[2]	Seawater DOC CRM (LOT#03-12) and low carbon water (LCW) were purchased from University of Miami http://yyy.rsmas.miami.edu/groups/biogeochem/CRM.html
[3]	Sample bottle cracked, no data reported
[4]	The laboratory DI water was found to be elevated in OC. The samples were not impacted by the DI water issue. See the QC narrative for more discussion.
HTCO	High Temperature Catalytic Oxidation

QA/QC NARRATIVE

PROJECT: Sinclair and Dyes Inlet Ambient Monitoring, June 2013 (AMB13)

PARAMETER: Total and Dissolved Metals – Al, Ag, Cd, Cr, Cu, Ni, Pb, Zn, Hg
Total Suspended Solids (TSS), Salinity (OSAL), Dissolved Organic Carbon (DOC), and Total Organic Carbon (TOC)

LABORATORY: Battelle Marine Sciences Laboratory (MSL), Sequim, Washington

MATRIX: Seawater and Freshwater

SAMPLE CUSTODY AND PROCESSING: Samples were collected from Sinclair and Dyes Inlet region by MSL and the U.S. Navy on 6/18/2013 and 06/19/2013. Samples were hand delivered to MSL by the field team. All samples were received in good condition. Samples were assigned a Battelle Central File (CF) identification number (3106) and were entered into Battelle's sample tracking system. Upon receipt at MSL, the samples designated for total and dissolved metals (TME/DME) were shaken vigorously and approximately 500mL was filtered through a pre-cleaned 0.45µm polyvinylidene fluoride (PVDF) filter membrane inside a class 100 clean bench and the filtrate was transferred to a trace metal clean Teflon bottle. The dissolved and total fractions were each acidified to a pH of < 2.0 with double distilled nitric acid. The samples for TSS and OSAL were stored at 4.0±2°C in low density polyethylene bottles prior to analysis. The samples for TOC and DOC were collected in pre-cleaned glass and stored at -20°C until analyses.

The following lists information on sample receipt and processing activities:

Sample Receipt Dates:	06/18/13 and 06/19/13 EQP BLKS 06/19/13
Cooler temp. on arrival	All coolers were at 4.0±2°C
Collection dates	06/18/13 and 06/19/13 EQP BLKS 06/19/13
TSS analysis dates	06/21/13, 06/24/13, and 06/26/13
OSAL analysis dates	06/21/13 and 06/24/13
CVAF analysis dates (Hg)	07/24 through 07/26/13, 07/28/13, 07/29/13
TRM Prep/Freshwater Analysis by ICP-MS (Ag, Al, Cr, Cr, Cu, Ni, Pb, Zn)	07/25/13 and 07/22/13
Fe/Pd Preconcentration Seawater Analysis by ICP-MS (Ag, Al, Cd, Cr, Cu, Ni, Pb, Zn)	07/18/13, 07/19/13, 07/22/13, 07/25/13
TOC/DOC Analysis Date	06/27/13 through 07/03/13

QA/QC NARRATIVE

QA/QC DATA QUALITY OBJECTIVES FOR SEAWATER SAMPLES:

Mercury	CVAF	70-130%	≤20%	≤30%	0.1 ng/L	0.32 ng/L

METHODS:

Seawater samples were analyzed for ten metals: aluminum (Al), arsenic (As), cadmium (Cd), chromium (Cr), copper (Cu), nickel (Ni), lead (Pb), silver (Ag), zinc (Zn), and mercury (Hg). Samples were submitted for analyses following two methods. The analyses of Hg does not require a salt removal technique prior to analyses, therefore, the data are not reported as reagent blank corrected. All samples were analyzed for Hg by Cold Vapor Atomic Fluorescence (CVAF) in accordance with Battelle SOP *MSL-I-013*, *Total Mercury in Aqueous Samples by CVAF*, following EPA Method 1631 revision E. The Hg data are reported in ng/L.

Seawater samples were analyzed for all other metals following preconcentration via a precipitation step followed by reconstitution in a salt free solution in accordance with Battelle SOP *MSL-I-025, Methods of Sample Preconcentration: Iron and Palladium/APDC Coprecipitation and Borohydride (Fe/Pd) Reductive Precipitation*

METHODS (cont): *for Trace Metals Analysis in Water.* Preconcentrated seawater samples were analyzed by Inductively Coupled Plasma-Mass Spectrometry (ICP-MS) in accordance with Battelle SOP *MSL-I-022, Determination of Elements in Aqueous and Digestate Samples by ICP/MS.* The base methods for this procedure are EPA Method 1638 and EPA Method 1640.

Freshwater samples identified as < 5% seawater were analyzed as follows, except Hg, which does not require a different method for freshwater versus saltwater. The other metals were determined by ICP-MS following the preparation method for total recoverable metals (TRM) described in EPA Method 1640 followed by analyses by ICP-MS.

The preconcentrated results were reported in units of µg/L. Data were reagent blank corrected for all metals (except Hg) and data were flagged with a "b". The required preconcentration procedure for ICP-MS analyses includes the addition of chelating agents to induce precipitation of metals under specific conditions. Subsequently, reagents added to the samples should be of the purest quality to result in zero addition of metals to the seawater samples. Required reagents have trace impurities of these metals; therefore, the data are blank corrected for these elements. Results were corrected using the mean batch reagent blank identified for each preparation batch as BMRB_analysis date and provided in the table identified as the QC Results for ICP-MS.

The TSS samples were analyzed following SM2540Dmod using a gravimetric analysis. The modification occurs in the use of a polycarbonate filter versus a glass fiber filter. A comparison between the glass fiber filters (GF/C) and the polycarbonate was conducted on AMB10 and AMB11. In almost all cases the GF/C filters over estimated the TSS concentration. The SOP has been modified to reflect the changes in the type of filter used for isolation of the TSS. No other changes were made to the standard method protocol. The data are reported in units of mg/L.

The OSAL samples were measured using a YSI-30 S-C-T probe. The data are reported in practical salinity units (PSU). The TOC and DOC samples were analyzed using a High Temperature Catalytic Oxidation (HTCO) method. The instrument is specially equipped with high-salt sample combustion tube kit and halogen scrubber for seawater analysis. Seawater samples were acidified to pH <2 by concentrated hydrochloric acid (trace metal grade, Fisher Chemical) prior to analysis then sparged for 2 minutes to remove inorganic carbon (IC). The non-purgeable organic carbons (NPOC) in samples were further converted to CO_2 by oxidation at 680°C with a platinum catalyst. A non-dispersive infrared detector (NDIR) was used to detect the converted CO_2 for quantification of NPOC. The data are reported as both mg/L and µM.

HOLDING TIMES: All samples were analyzed within the established holding times of 90 days for Hg, six months for all other metals, and 7 days between collection and filtration for TSS.

DETECTION LIMITS: Laboratory method detection limits (MDLs) for seawater are reported from the Annually Verified Seawater MDL Study as determined by seven replicates of Sequim Bay Seawater spiked at an appropriate concentration for each analyte. The freshwater MDL was reported from the Annually Verified Freshwater MDL Study determined using seven replicates of deionized water prepared using the TRM preparation. Reporting limits are determined as 3.18 times the laboratory achieved MDL. The data are evaluated and flagged as follows:

U Analyte not detected at or above the MDL, MDL reported
J Analyte detected above the MDL, but less than the RL
N Spiked sample recovery outside QC criterion of 70-130%

& Accuracy result outside QC criterion of ≤20% PD
* Precision result outside QC criterion of <30%
B Analyte detected in the method blank > RL and sample concentration < 10 times detected blank value
c Exceeds data quality objective but meets contingency criterion
b Result is reagent blank corrected using the batch specific blank (BMRB)

METHOD BLANKS: A minimum of three method blanks were analyzed by each instrument with each analytical batch for metals. The average method blank for each batch was less than the RL for all metals except several seawater replicates for Zn and one freshwater replicate for Cr. The seawater preconcentration procedure required to remove salt interferences prior to ICP-MS analysis includes the addition of chelating agents to induce precipitation of metals under specific conditions, as discussed in the method section above. The data were evaluated and qualified with a "B" if the sample concentration was less than ten times the mean detected blank if the blank was above the RL. The reagent blank correction takes into consideration the detected blank for each batch and the seawater data for all metals except Hg should be reported as corrected in order to more accurately represent the true sample concentrations. The data were not considered impacted by the detected Zn blanks. The freshwater Cr blank was detected above the RL and the data were qualified with a "B" flag. The data were not significantly impacted by the detected blank.

The method blank for TSS is a polycarbonate filter (Nucleopore) taken through the analytical process with each batch of samples. The blanks were all less than the MDL. The method blanks for TOC and DOC was deionized water. In addition, low carbon water (LCW) purchased from University of Miami was analyzed as part of the HTCO calibration curve to demonstrate that the instrumentation was not contributing carbon. The deionized water polisher canisters were replaced on 07/01/13 between the analysis of the blank checks at 1333 and 2238. The elevated blank measured at 2238 triggered a review of the data. House DI water was used as a CCB and also for the preparation of 1 ppm carbon CCV. This house DI water was also used to rinse the autosampler between each run. These samples showed elevated carbon in the CCV (increased from normally ~1.10 ppm to ~1.30 ppm) and CCB (increased from normally ~0.05 ppm to ~0.20 ppm). However, the following observations suggest that the instrument was in good performance and was not affected by the use of house DI water:

1. All University of Miami Low carbon water (LCW) and CRM, which were analyzed coupled with CCV/CCB, have consistent values compared to the past analysis. The LCW values are consistently low (~0.03 ppm), which also suggests that the rinsing with House DI water didn't create contamination problems (note that at that time the House DI water is ~0.20 ppm). The CRM values are right within the tight ideal range of this CRM (41-44 uM).
2. A measurement of a Milli-Q ultrapure water from Biotechnology lab downstairs also has very low OC value (0.037 ppm).
3. The House DI water OC (~0.20 ppm) is still lower than 10 X MDL (0.25 ppm).
4. All samples in that batch are TOC samples and their average measured concentrations are ~7.5 times of House DI water OC value, which means that the sample concentrations are much higher than instrument rinsing water.

Therefore, the data are not considered impacted by the House DI water problem and are acceptable. In the analytical batch 070313, the House DI water OC concentration was down to ~0.05 ppm and was considered back to normal.

LABORATORY CONTROL A minimum of one LCS (OPR or blank spike) was prepared and analyzed with each analytical batch of 20 or fewer samples for metals. Percent recoveries for LCS samples

QA/QC NARRATIVE

SAMPLES: were within the QC acceptance criterion of 70% to 130% for all metals. The LCS matrix for the seawater samples was Sequim Bay Seawater prepared as both spiked and unspiked samples.

MATRIX SPIKE ACCURACY: A minimum of one set of duplicate matrix spikes (MS/MSD) was prepared and analyzed with each analytical batch of 20 or fewer samples for metals. Percent recoveries for matrix spikes were within the QC limits of 70% to 130% for all metals spiked at an appropriate level relative to the native sample concentration.

REPLICATE PRECISION: Laboratory precision was expressed as the relative percent difference (RPD) between laboratory duplicates. The RPD values for the laboratory duplicates were within the QC acceptance criterion of ±30% for all metals detected above the RL and for the TOC/DOC analyses.

STANDARD REFERENCE MATERIAL ACCURACY: Standard reference materials (SRM) were prepared and analyzed with each analytical batch at a minimum frequency of 1 per 20 or fewer samples. Analytical accuracy was expressed as the percent difference (PD) between the measured and the certified value. The SRM for Hg was 1641d, a freshwater SRM, as no seawater SRM was available. The percent recoveries were within the QC acceptance criterion of 80-120%.

Three different SRMs were analyzed with the analytical batches for Ag, Al, Cd, Cr, Cu, Ni, Pb, and Zn quantified by ICP-MS. The freshwater SRM 1640a demonstrated analytical accuracy for each batch analyzed by ICP-MS and the freshwater sample matrices (e.g. outfall 021). Percent recoveries were within the QC acceptance criterion. There are no seawater SRMs certified for Ag and Al. High purity standards and the freshwater SRM were used to evaluate analytical accuracy.

Two seawater SRMs were analyzed with each ICP-MS batch. The primary SRM was the coastal SRM CASS-5 and the secondary was the estuarine SRM SLEW-3. Both were prepared with each batch of preconcentrated samples. The PDs were within the QC criterion for all metals certified greater than 10x the MDL, except one replicate of CASS-5 for Zn (PD = 27%). The "c" flag denotes those that exceeded the QC criterion, but were not greater than 10x the MDL.

The SRM Copenhagen Water was used to verify the accuracy of the salinity measurements. The accuracy was 0.3-8% PD for all salinity measurements. There are no SRMs available for TOC or DOC. University of Miami provides a laboratory consensus value for DOC in estuarine water http://yyy.rsmas.miami.edu/groups/biogeochem/CRM.html The average of the reference value range was used to calculate the PD for each replicate. The PD ranged from 1.8 to 13%.

ALS ENVIRONMENTAL

Client:	Battelle Marine Sciences Lab	**Service Request No.:**	K1305955
Project:	June 2013 Ambient Monitoring (AMB13)	**Date Received:**	06/20/13
Sample Matrix:	Water and Ocean Water		

Case Narrative

All analyses were performed consistent with the quality assurance program of ALS Environmental. This report contains analytical results for samples designated for Tier IV validation deliverables including summary forms and all of the associated raw data for each of the analyses. When appropriate to the method, method blank results have been reported with each analytical test.

Sample Receipt

One water and one ocean water sample was received for analysis at ALS Environmental on 06/20/13. The samples were received in good condition and consistent with the accompanying chain of custody form. The samples were stored in a refrigerator at 4°C upon receipt at the laboratory.

General Chemistry Parameters

No anomalies associated with the analysis of these samples were observed.

ALS ENVIRONMENTAL

Client:	Battelle Marine Sciences Lab	**Service Request No.:**	K1306033
Project:	JUNE 2013 Ambient Monitoring (AMB13)	**Date Received:**	06/21/13
Sample Matrix:	Ocean Water		

Case Narrative

All analyses were performed consistent with the quality assurance program of ALS Environmental. This report contains analytical results for samples designated for Tier IV validation deliverables including summary forms and all of the associated raw data for each of the analyses. When appropriate to the method, method blank results have been reported with each analytical test.

Sample Receipt

Forty-two ocean water samples were received for analysis at ALS Environmental on 06/21/13. The samples were received in good condition and consistent with the accompanying chain of custody form. The samples were stored in a refrigerator at 4°C upon receipt at the laboratory.

General Chemistry Parameters

No anomalies associated with the analysis of these samples were observed.

Approved by_____

Results flagged with an asterisk (*) indicate values outside control criteria.

Results flagged with a pound (#) indicate the control criteria is not applicable.

Percent recoveries and relative percent differences (RPD) are determined by the software using values in the calculation which have not been rounded.

Results flagged with an asterisk (*) indicate values outside control criteria.

Results flagged with a pound (#) indicate the control criteria is not applicable.

Percent recoveries and relative percent differences (RPD) are determined by the software using values in the calculation which have not been rounded.

LOG-IN CHECKLIST

Reference SOP# MSL-A-001

Central File #: 3106 Sample No(s): 1096-1149 Batch: 32

Project Name: Enviest AMB13 - DAYL Project Manager: JMB

TO BE COMPLETED BY PROJECT MANAGER (prior to arrival when possible)

Matrix: Salt Water WP#

Yes	No	
☐	☐	Navy-type Project (requires high-level sample tracking procedures)
☐	☐	USDA Samples (see Compliance Agreement Checklist)

PM Verification:

☐	☐	Filter Samples: Amount: Entire sample Half of sample
☐	☐	Freeze dry sample(s) - samples will be weighed and placed in ultralow temp freezer (Login Lab)
☐	☐	Special instructions:

Sample Preservation Instructions:

See LIMS for archive/disposal information

TO BE COMPLETED UPON SAMPLE ARRIVAL/LOG-IN

Yes	No	N/A	Indicate in Appropriate Box
☐	☐	☑	Custody seal present Seal intact? YES NO
☑	☐	☐	Cooler temperature (acceptable range: 4±2°C or solids:frozen) (if multiple coolers, note temp. of each)
☐	☐	☑	Project Manager notified of any custody/login discrepancies (cooler temp, sponsor codes, etc)
☑	☐	☐	Were all chain of custody forms signed and dated?
☑	☐	☐	Were samples filtered at MSL?

Received from field 4±2 °C

°C

Comment/Remedy:

Sample condition(s): Acceptable Other (explain):

Container type: Teflon Poly Glass Cap. Vial Other:

Notes: Logged in 6/19/13 (Samples arrived @ MSL 1933 on 6/18/13)

Completed By: Date/Time: 6/19/13 0650

SAMPLE PRESERVATION

☐	Sample(s) were preserved prior to arrival at MSL (noted on CoC / Sample / per PM Instruction)		
☐	Random pH checked for ~10% of samples (use dip paper)	Sample IDs:	
☐	Complete pH check required for project (use pH meter and record on pH Record form)		
☐	Sample(s) were preserved at MSL		
Type: ☑	0.2% HNO3 (Nutrients)	Notes: Nutrients	Lot#
☐	0.5% HCl (Hg samples)	Notes:	Lot#
☑	Refrigerate/Freeze	Notes: TSS/DOC/TOC	
☑	Other	Notes: DIG Shipped to ALS	

Completed By: 6/19/13 Date/Time: 06/18/13 placed in storage

Storage Shelf: Nutrients - Lab 231

LOG-IN CHECKLIST

Reference SOP# MSL-A-001

Central File #: 3106 Sample No(s): 1150 - 1189 Batch: 33

Project Name: AMB13 Day 2 + EB Project Manager: JMA

TO BE COMPLETED BY PROJECT MANAGER (prior to arrival when possible)

Matrix: seawater WP#

Yes	No	
☐	☑	Navy-type Project (requires high-level sample tracking procedures)
☐	☑	USDA Samples (see Compliance Agreement Checklist)

PM Verification:

☑	☐	Filter Samples: Amount: Entire sample Half of sample
☐	☑	Freeze dry sample(s) - samples will be weighed and placed in ultralow temp freezer (Login Lab)
☑	☐	Special instructions:

Sample Preservation Instructions: see Day 1

See LIMS for archive/disposal information

TO BE COMPLETED UPON SAMPLE ARRIVAL/LOG-IN

Yes	No	N/A	Indicate in Appropriate Box
☐	☐	☑	Custody seal present Seal intact? YES NO
☑	☐	☐	Cooler temperature (acceptable range: 4±2°C or solids:frozen) (if multiple coolers, note temp. of each) 5 coolers all 4±2°C °C
☐	☐	☑	Project Manager notified of any custody/login discrepancies (cooler temp, sponsor codes, etc) Comment/Remedy:
☑	☐	☐	Were all chain of custody forms signed and dated?
☑	☐	☐	Were samples filtered at MSL?

Sample condition(s): Acceptable Other (explain):

Container type: Teflon Poly Glass Cap. Vial Other:

Notes:

Completed By: JMA Date/Time: 6/19/13 1638

SAMPLE PRESERVATION

☐ Sample(s) were preserved prior to arrival at MSL (noted on CoC / Sample / per PM Instruction)

☐ Random pH checked for ~10% of samples (use dip paper) Sample IDs:

☐ Complete pH check required for project (use pH meter and record on pH Record form)

☑ Sample(s) were preserved at MSL

Type:			
☑	0.2% HNO3	Notes: JMA	Lot# 12/2020
☐	0.5% HCl (Hg samples)	Notes:	Lot#
☐	Refrigerate/Freeze	Notes:	
☐	Other	Notes:	

Completed By: Date/Time: 13:00 6/20/13

Storage Shelf: L-1-A, L-2-C, K-1-D

Metals in Water

DATA QUALIFIERS:

c	Exceeds DQO but meets contingency criteria of either:
1	SRM certified <10x MDL
2	Insufficient spiking level relative to native sample concentrations
3	Sample concentration <10x MDL
U	Analyte not detected at or above the MDL, MDL reported
J	Analyte detected above the MDL, but less than the RL
--	Not analyzed
NA	Not applicable/available
N	Spiked sample recovery outside QC criterion of 70-130%
NC	Not Certified
&	Accuracy result outside QC criterion of ≤20% PD
*	Precision result outside QC criterion of <30%
NS	Sample not spiked for this analyte
B	Analyte detected in the method blank > RL
	and sample concentration < 10 times detected blank value
b	Data are blank corrected using the batch specific procedural blank
[1]	Reported from the nucleopore filtration method instead of GF/C filters
[2]	Seawater DOC CRM (LOT#03-12) and low carbon water (LCW) were purchased from University of Miami http://yyy.rsmas.miami.edu/groups/biogeochem/CRM.html
[3]	Sample bottle cracked, no data reported
[4]	The laboratory DI water was found to be elevated in OC. The samples were not impacted by the DI water issue. See the QC narrative for more discussion.
HTCO	High Temperature Catalytic Oxidation

QA/QC NARRATIVE

PROJECT: Sinclair and Dyes Inlet Ambient Monitoring, February 2014 (AMB14)

PARAMETER: Total and Dissolved Metals – Al, Ag, Cd, Cr, Cu, Ni, Pb, Zn, Hg
Total Suspended Solids (TSS), Salinity (OSAL), Dissolved Organic Carbon (DOC), and Total Organic Carbon (TOC)

LABORATORY: Battelle Marine Sciences Laboratory (MSL), Sequim, Washington

MATRIX: Seawater and Freshwater

SAMPLE CUSTODY AND PROCESSING: Samples were collected from Sinclair and Dyes Inlet region by MSL and the U.S. Navy on 2/19/2014 and 02/20/2014. Samples were hand delivered to MSL by the field team. All samples were received in good condition. Samples were assigned a Battelle Central File (CF) identification number (3106) and were entered into Battelle's sample tracking system. Upon receipt at MSL, the samples designated for total and dissolved metals (TME/DME) were shaken vigorously and approximately 500mL was filtered through a pre-cleaned 0.45µm polyvinylidene fluoride (PVDF) filter membrane inside a class 100 clean bench and the filtrate was transferred to a trace metal clean Teflon bottle. The dissolved and total fractions were each acidified to a pH of < 2.0 with double distilled nitric acid. The samples for TSS and OSAL were stored at 4.0±2°C in low density polyethylene bottles prior to analysis. The samples for TOC and DOC were collected in pre-cleaned glass and stored at -20°C until analyses.

The following lists information on sample receipt and processing activities:

Sample Receipt Dates:	2/19/2014 and 02/20/2014 EQP BLKS 02/20/2014
Cooler temp. on arrival	All coolers were at 4.0±2°C
Collection dates	2/19/2014 and 02/20/2014 EQP BLKS 02/20/2014
TSS analysis dates	2/27/2014, and 2/28/2014
OSAL analysis dates	2/19/2014 and 02/20/2014
CVAF analysis dates (Hg)	03/21/14, 03/25/13, 03/28/14, 03/31/14, and 04/01/14
TRM Prep/Freshwater Analysis by ICP-MS (Ag, Al, Cr, Cr, Cu, Ni, Pb, Zn)	04/02/14
Fe/Pd Preconcentration Seawater Analysis by ICP-MS (Ag, Al, Cd, Cr, Cu, Ni, Pb, Zn)	04/01/14, and 04/09/14
TOC/DOC Analysis Date	03/20/14 through 03/26/14

QA/QC NARRATIVE

QA/QC DATA QUALITY OBJECTIVES FOR SEAWATER SAMPLES:

Mercury	CVAF	70-130%	≤20%	≤30%	0.1 ng/L	0.32 ng/L

METHODS:

Seawater samples were analyzed for ten metals: aluminum (Al), arsenic (As), cadmium (Cd), chromium (Cr), copper (Cu), nickel (Ni), lead (Pb), silver (Ag), zinc (Zn), and mercury (Hg). Samples were submitted for analyses following two methods. The analyses of Hg does not require a salt removal technique prior to analyses, therefore, the data are not reported as reagent blank corrected. All samples were analyzed for Hg by Cold Vapor Atomic Fluorescence (CVAF) in accordance with Battelle SOP *MSL-I-013*, *Total Mercury in Aqueous Samples by CVAF*, following EPA Method 1631 revision E. The Hg data are reported in ng/L.

Seawater samples were analyzed for all other metals following preconcentration via a precipitation step followed by reconstitution in a salt free solution in accordance with Battelle SOP *MSL-I-025, Methods of Sample Preconcentration: Iron and Palladium/APDC Coprecipitation and Borohydride (Fe/Pd) Reductive Precipitation*

METHODS (cont): *for Trace Metals Analysis in Water.* Preconcentrated seawater samples were analyzed by Inductively Coupled Plasma-Mass Spectrometry (ICP-MS) in accordance with Battelle SOP *MSL-I-022, Determination of Elements in Aqueous and Digestate Samples by ICP/MS.* The base methods for this procedure are EPA Method 1638 and EPA Method 1640.

Freshwater samples identified as < 5% seawater were analyzed as follows, except Hg, which does not require a different method for freshwater versus saltwater. The other metals were determined by ICP-MS following the preparation method for total recoverable metals (TRM) described in EPA Method 1640 followed by analyses by ICP-MS.

The preconcentrated results were reported in units of µg/L. Data were reagent blank corrected for all metals (except Hg) and data were flagged with a "b". The required preconcentration procedure for ICP-MS analyses includes the addition of chelating agents to induce precipitation of metals under specific conditions. Subsequently, reagents added to the samples should be of the purest quality to result in zero addition of metals to the seawater samples. Required reagents have trace impurities of these metals; therefore, the data are blank corrected for these elements. Results were corrected using the mean batch reagent blank identified for each preparation batch as BMRB_analysis date and provided in the table identified as the QC Results for ICP-MS.

The TSS samples were analyzed following SM2540Dmod using a gravimetric analysis. The modification occurs in the use of a polycarbonate filter versus a glass fiber filter. A comparison between the glass fiber filters (GF/C) and the polycarbonate was conducted on AMB10 and AMB11. In almost all cases the GF/C filters over estimated the TSS concentration. The SOP has been modified to reflect the changes in the type of filter used for isolation of the TSS. No other changes were made to the standard method protocol. The data are reported in units of mg/L.

The OSAL samples were measured using a YSI-30 S-C-T probe. The data are reported in practical salinity units (PSU). The TOC and DOC samples were analyzed using a High Temperature Catalytic Oxidation (HTCO) method. The instrument is specially equipped with high-salt sample combustion tube kit and halogen scrubber for seawater analysis. Seawater samples were acidified to pH <2 by concentrated hydrochloric acid (trace metal grade, Fisher Chemical) prior to analysis then sparged for 2 minutes to remove inorganic carbon (IC). The non-purgeable organic carbons (NPOC) in samples were further converted to CO_2 by oxidation at 680°C with a platinum catalyst. A non-dispersive infrared detector (NDIR) was used to detect the converted CO_2 for quantification of NPOC. The data are reported as both mg/L and µM.

HOLDING TIMES: All samples were analyzed within the established holding times of 90 days for Hg, six months for all other metals, and 7 days between collection and filtration for TSS.

DETECTION LIMITS: Laboratory method detection limits (MDLs) for seawater are reported from the Annually Verified Seawater MDL Study as determined by seven replicates of Sequim Bay Seawater spiked at an appropriate concentration for each analyte. The freshwater MDL was reported from the Annually Verified Freshwater MDL Study determined using seven replicates of deionized water prepared using the TRM preparation. Reporting limits are determined as 3.18 times the laboratory achieved MDL. The data are evaluated and flagged as follows:

U Analyte not detected at or above the MDL, MDL reported
J Analyte detected above the MDL, but less than the RL
N Spiked sample recovery outside QC criterion of 70-130%

& Accuracy result outside QC criterion of ≤20% PD
* Precision result outside QC criterion of <30%
B Analyte detected in the method blank > RL and sample concentration < 10 times detected blank value
c Exceeds data quality objective but meets contingency criterion
b Result is reagent blank corrected using the batch specific blank (BMRB)

METHOD BLANKS: A minimum of three method blanks were analyzed by each instrument with each analytical batch for metals. The average method blank for each batch was less than the RL for all metals except Zn in the 040914 reagent blanks. The seawater preconcentration procedure required to remove salt interferences prior to ICP-MS analysis includes the addition of chelating agents to induce precipitation of metals under specific conditions, as discussed in the method section above. The data were evaluated and qualified with a "B" if the sample concentration was less than ten times the mean detected blank and the blank was above the RL. The reagent blank correction takes into consideration the detected blank for each batch. The seawater data for all metals except Hg should be reported as corrected in order to more accurately represent the true sample concentrations. The data were not considered impacted by the detected Zn blanks.

The method blank for TSS is a polycarbonate filter (Nucleopore) taken through the analytical process with each batch of samples. The blanks were all less than the MDL. The method blanks for TOC and DOC was deionized water. In addition, low carbon water (LCW) purchased from University of Miami was analyzed as part of the HTCO calibration curve to demonstrate that the instrumentation was not contributing carbon.

LABORATORY CONTROL SAMPLES: A minimum of one LCS (OPR or blank spike) was prepared and analyzed with each analytical batch of 20 or fewer samples for metals. Percent recoveries for LCS samples were within the QC acceptance criterion of 70% to 130% for all metals. The LCS matrix for the seawater samples was Sequim Bay Seawater prepared as both spiked and unspiked samples.

MATRIX SPIKE ACCURACY: A minimum of one set of duplicate matrix spikes (MS/MSD) was prepared and analyzed with each analytical batch of 20 or fewer samples for metals. Percent recoveries for matrix spikes were within the QC limits of 70% to 130% for all metals spiked at an appropriate level relative to the native sample concentration. Sample 1232 contained a native sample concentration of 2.3 ppb for Zn and was spiked at 5 ppb. The spiking level was just greater than two times the native sample concentration and considered underspiked. The data are qualified. Alternate matrix spikes demonstrate acceptable accuracy and precision for Zn in this seawater matrix. No additional actions were required.

REPLICATE PRECISION: Laboratory precision was expressed as the relative percent difference (RPD) between laboratory duplicates. The RPD values for the laboratory duplicates were within the QC acceptance criterion of ±30% for all parameters detected above the RL.

STANDARD REFERENCE MATERIAL ACCURACY: Standard reference materials (SRM) were prepared and analyzed with each analytical batch at a minimum frequency of 1 per 20 or fewer samples. Analytical accuracy was expressed as the percent difference (PD) between the measured and the certified value. The SRM for Hg was 1641d, a freshwater SRM, as no seawater SRM was available. The percent recoveries were within the QC acceptance criterion of 80-120%.

Two SRMs were analyzed with the analytical batches for Ag, Al, Cd, Cr, Cu, Ni, Pb, and Zn quantified by ICP-MS. The freshwater SRM 1640a demonstrated analytical accuracy for each batch analyzed by ICP-MS and the freshwater sample matrices (e.g. outfall 021). Percent recoveries were within the QC acceptance criterion. There are no

seawater SRMs certified for Ag and Al. High purity standards and the freshwater SRM were used to evaluate analytical accuracy.

CASS-5 is a seawater SRMs analyzed with each ICP-MS batch. The PDs were within the QC criterion for all metals certified greater than 10x the MDL, except three replicates of CASS-5 for Zn. The "c" flag denotes those that exceeded the QC criterion, but were not greater than 10x the MDL. The freshwater SRM, MS/MSD, and LCS all verify that the Zn analysis was within the QC tolerances. A new batch of reagents was used for the Fe/Pd and therefore, reagent correction was essential to provide representative data.

The SRM Copenhagen Water was used to verify the accuracy of the salinity measurements. The accuracy was 0.8-1.4% PD for all salinity measurements. There are no SRMs available for TOC or DOC. University of Miami provides a laboratory consensus value for DOC in estuarine water http://yyy.rsmas.miami.edu/groups/biogeochem/CRM.html The average of the reference value range was used to calculate the PD for each replicate. The PD ranged from 6.3 to 20%.

ALS ENVIRONMENTAL

Client:	Battelle Marine Sciences Lab	**Service Request No.:**	K1401739
Project:	Feb 2014 Ambient Monitoring (AMB14)	**Date Received:**	02/21/14
Sample Matrix:	Ocean Water		

Case Narrative

All analyses were performed consistent with the quality assurance program of ALS Environmental. This report contains analytical results for samples designated for Tier IV validation deliverables including summary forms and all of the associated raw data for each of the analyses. When appropriate to the method, method blank results have been reported with each analytical test.

Sample Receipt

Two ocean water samples were received for analysis at ALS Environmental on 02/21/14. The samples were received in good condition and consistent with the accompanying chain of custody form. The samples were stored in a refrigerator at 4ºC upon receipt at the laboratory.

General Chemistry Parameters

No anomalies associated with the analysis of these samples were observed.

Case Narrative

All analyses were performed consistent with the quality assurance program of ALS Environmental. This report contains analytical results for samples designated for Tier IV validation deliverables including summary forms and all of the associated raw data for each of the analyses. When appropriate to the method, method blank results have been reported with each analytical test.

Sample Receipt

Forty-four ocean water samples were received for analysis at ALS Environmental on 02/22/14. The samples were received in good condition and consistent with the accompanying chain of custody form. The samples were stored in a refrigerator at 4ºC upon receipt at the laboratory.

General Chemistry Parameters

Ammonia as Nitrogen by EPA Method 350.1:
The Relative Percent Difference (RPD) criterion for the replicate analysis in samples AMB14-001/PS03, AMB14-021/M3.1 and AMB14-216/M8 were not applicable because the analyte concentration was not significantly greater than the Method Reporting Limit (MRL). Analytical values derived from measurements close to the detection limit are not subject to the same accuracy and precision criteria as results derived from measurements higher on the calibration range for the method.

The matrix spike recovery for sample AMB14-216/M8 was outside control criteria because of suspected matrix interference. As a result of the interference, the results for this analyte contained a potential low bias. No further corrective action was taken.

Total Phosphorus by EPA Method 365.3:
The Relative Percent Difference (RPD) criterion for the replicate analysis in sample AMB14-015/PS16 was not applicable because the analyte concentration was not significantly greater than the Method Reporting Limit (MRL). Analytical values derived from measurements close to the detection limit are not subject to the same accuracy and precision criteria as results derived from measurements higher on the calibration range for the method.

No other anomalies associated with the analysis of these samples were observed.

Results flagged with an asterisk (*) indicate values outside control criteria.

Results flagged with a pound (#) indicate the control criteria is not applicable.

Percent recoveries and relative percent differences (RPD) are determined by the software using values in the calculation which have not been rounded.

Results flagged with an asterisk (*) indicate values outside control criteria.

Results flagged with a pound (#) indicate the control criteria is not applicable.

Percent recoveries and relative percent differences (RPD) are determined by the software using values in the calculation which have not been rounded.

Results flagged with an asterisk (*) indicate values outside control criteria.

Results flagged with a pound (#) indicate the control criteria is not applicable.

Percent recoveries and relative percent differences (RPD) are determined by the software using values in the calculation which have not been rounded.

LOG-IN CHECKLIST

Reference SOP# MSL-A-001

Central File #: 31106 Sample No(s): 1242 - 1281 Batch: ~~34~~ 35

Project Name: AMB 14 Project Manager: JMB

TO BE COMPLETED BY PROJECT MANAGER (prior to arrival when possible)

Matrix: _____ WP# _____

Yes	No	
☐	☐	Navy-type Project (requires high-level sample tracking procedures)
☐	☐	USDA Samples (see Compliance Agreement Checklist)

PM Verification:

☐	☐	Filter Samples: Amount: Entire sample Half of sample
☐	☐	Freeze dry sample(s) - samples will be weighed and placed in ultralow temp freezer (Login Lab)
☐	☐	Special instructions:

Sample Preservation Instructions:

See LIMS for archive/disposal information

TO BE COMPLETED UPON SAMPLE ARRIVAL/LOG-IN

Hand delivered to Lab
Held in Walkin ref.
until login

Yes	No	N/A	Indicate in Appropriate Box
☐	☑	☐	Custody seal present Seal intact? YES NO
☑	☐	☐	Cooler temperature (acceptable range: 4±2°C or solids:frozen) (if multiple coolers, note temp. of each) _____ °C _____ °C
☐	☐	☑	Project Manager notified of any custody/login discrepancies (cooler temp, sponsor codes, etc) Comment/Remedy:
☑	☐	☐	Were all chain of custody forms signed and dated?
☑	☐	☐	Were samples filtered at MSL?

Sample condition(s): Acceptable Other (explain):

Container type: Teflon Poly Glass Cap. Vial Other:

THC DOC TSS SPC NUT TDC DOC O&G

Notes:

Completed By: _____ Date/Time: 02/20/14

SAMPLE PRESERVATION

☐ Sample(s) were preserved prior to arrival at MSL (noted on CoC / Sample / per PM Instruction)

☐ Random pH checked for ~10% of samples (use dip paper) Sample IDs:

☐ Complete pH check required for project (use pH meter and record on pH Record form)

☐ Sample(s) were preserved at MSL

Type:	☑	0.2% HNO3	Notes:	Lot#
	☐	0.5% HCl (Hg samples)	Notes:	Lot#
	☑	Refrigerate/Freeze — TDC DOC TSS	Notes:	
	☑	Other	Notes:	NUT shipped to CAS / O:G shipped to CAS

Completed By: _____ Date/Time: 02/20/14

6. Did all bottles arrive in good condition (unbroken)? *Indicate in the table below.* NA Y (N)
7. Were all sample labels complete (i.e analysis, preservation, etc.)? NA (Y) N
8. Did all sample labels and tags agree with custody papers? *Indicate major discrepancies in the table on page 2.* NA (Y) N
9. Were appropriate bottles/containers and volumes received for the tests indicated? NA (Y) N
10. Were the pH-preserved bottles (*see SMO GEN SOP*) received at the appropriate pH? *Indicate in the table below* (NA) Y N
11. Were VOA vials received without headspace? *Indicate in the table below.* (NA) Y N
12. Was C12/Res negative? (NA) Y N

Sample ID on Bottle	Sample ID on COC	Identified by:

Sample ID	Bottle Count Bottle Type	Out of Temp	Head-space	Broke	pH	Reagent	Volume added	Reagent Lot Number	Initials	Time
OF021 (AMBHDD 003)	1-liter OxG			✓					DW	9:40

Notes, Discrepancies, & Resolutions: Sample broken in cooler (frozen)

K1401787

Data Qualifiers
Ambient Monitoring - AMB15
ENVVEST June 2014

DATA QUALIFIERS:

c	Exceeds DQO but meets contingency criteria of either:
1	SRM certified <10x MDL
2	Insufficient spiking level relative to native sample concentrations
U	Analyte not detected at or above the MDL, MDL reported
J	Analyte detected above the MDL, but less than the RL
--	Not analyzed
NA	Not applicable/available
N	Spiked sample recovery outside QC criterion of 70-130%
NC	Not Certified
&	Accuracy result outside QC criterion of ≤20% PD
*	Precision result outside QC criterion of <30%
NS	Sample not spiked for this analyte
B	Analyte detected in the method blank > RL
	and sample concentration < 10 times detected blank value
b	Data are blank corrected using the batch specific procedural blank
[1]	Reported from the nucleopore filtration method instead of GF/C filters
[2]	Seawater DOC CRM (LOT#03-12) and low carbon water (LCW) were purchased from University of Miami http://yyy.rsmas.miami.edu/groups/biogeochem/CRM.html
[3]	Sample bottle cracked, no data reported
[4]	The laboratory DI water was found to be elevated in OC. The samples were not impacted by the DI water issue. See the QC narrative for more discussion.
HTCO	High Temperature Catalytic Oxidation

QA/QC NARRATIVE

PROJECT: Sinclair and Dyes Inlet Ambient Monitoring, June 2014 (AMB15)

PARAMETER: Total and Dissolved Metals – Al, Cd, Cr, Cu, Ni, Pb, Zn, Hg
Total Suspended Solids (TSS), Salinity (OSAL), Dissolved Organic Carbon (DOC), and Total Organic Carbon (TOC)

LABORATORY: Battelle Marine Sciences Laboratory (MSL), Sequim, Washington

MATRIX: Seawater and Freshwater

SAMPLE CUSTODY AND PROCESSING: Samples were collected from Sinclair and Dyes Inlet region by MSL and the U.S. Navy on 6/10/2014 and 06/11/2014. Samples were hand delivered to MSL by the field team. All samples were received in good condition. Samples were assigned a Battelle Central File (CF) identification number (3106) and were entered into Battelle's sample tracking system. Upon receipt at MSL, the samples designated for total and dissolved metals (TME/DME) were shaken vigorously and approximately 500mL was filtered through a pre-cleaned 0.45µm polyvinylidene fluoride (PVDF) filter membrane inside a class 100 clean bench and the filtrate was transferred to a trace metal clean Teflon bottle. The dissolved and total fractions were each acidified to a pH of < 2.0 with double distilled nitric acid. The samples for TSS and OSAL were stored at 4.0±2°C in low density polyethylene bottles prior to analysis. The samples for TOC and DOC were collected in pre-cleaned glass and stored at -20°C until analyses.

The following lists information on sample receipt and processing activities:

Sample Receipt Dates:	6/10/2014 and 06/11/2014 EQP BLKS 06/04/2014
Cooler temp. on arrival	All coolers were at 4.0±2°C
Collection dates	6/10/2014 and 06/11/2014 EQP BLKS 06/04/2014
TSS analysis dates	06/14/14
OSAL analysis dates	06/13/14
CVAF analysis dates (Hg)	07/31/14, 08/05/14, 08/07/14, 08/12/14, and 08/14/14
TRM Prep/Freshwater Analysis by ICP-MS (Al, Cr, Cr, Cu, Ni, Pb, Zn)	06/04/14 (EBs), 07/25/14

Mercury	CVAF	70-130%	≤20%	≤30%	0.1 ng/L	0.32 ng/L

METHODS:

Seawater samples were analyzed for ten metals: aluminum (Al), arsenic (As), cadmium (Cd), chromium (Cr), copper (Cu), nickel (Ni), lead (Pb), silver (Ag), zinc (Zn), and mercury (Hg). Samples were submitted for analyses by two methods. Both freshwater and seawater samples were analyzed for Hg by Cold Vapor Atomic Fluorescence (CVAF) in accordance with Battelle SOP *MSL-I-013*, *Total Mercury in Aqueous Samples by CVAF*, following EPA Method 1631 revision E. The Hg data are reported in ng/L.

Seawater samples were analyzed for all other metals using a preconcentration via a precipitation step followed by reconstitution in a salt free solution in accordance with Battelle SOP *MSL-I-025, Methods of Sample Preconcentration: Iron and Palladium/APDC Coprecipitation and Borohydride (Fe/Pd) Reductive Precipitation for Trace Metals Analysis in Water.* Preconcentrated seawater samples were analyzed by Inductively Coupled Plasma-Mass Spectrometry (ICP-MS) in accordance with Battelle SOP *MSL-I-022, Determination of Elements in Aqueous and Digestate*

METHODS (cont): *Samples by ICP/MS.* The base methods for this procedure are EPA Method 1638 and EPA Method 1640.

Freshwater samples identified as < 5% seawater were analyzed for all metals, except Hg, by ICP-MS following the preparation method for total recoverable metals (TRM) described in EPA Method 1640. The analysis for Hg does not require a different method for freshwater versus saltwater.

The ICP-MS data were reported in units of µg/L. The required preconcentration procedure for seawater samples analyzed by ICP-MS includes the addition of chelating agents to induce precipitation of metals under specific conditions. Subsequently, reagents added to the samples should be of the purest quality to result in zero addition of metals to the seawater samples. Required reagents have trace impurities of these metals; therefore, the data are blank corrected for these elements. In previous AMB data sets, the mean reagent blank for each analytical batch was subtracted from the reported sample concentration after the analyses were completed and data were qualified with a "b". The new ICP-MS analytical method includes a matrix matching procedure that allows the quantification of the small concentrations of metals added to the samples during the Fe/Pd preparation to be subtracted from the sample during the analyses. The correction of the data allows it to be directly compared to all previous AMB events, but does not require the addition of the "b" data qualifier to the ICP-MS data.

The TSS samples were analyzed following SM2540Dmod using a gravimetric analysis. The modification occurs in the use of a polycarbonate filter versus a glass fiber filter. A comparison between the glass fiber filters (GF/C) and the polycarbonate was conducted on AMB10 and AMB11. In almost all cases the GF/C filters over estimated the TSS concentration. The SOP has been modified to reflect the changes in the type of filter used for isolation of the TSS. No other changes were made to the standard method protocol. The data are reported in units of mg/L.

The OSAL samples were measured using a YSI-30 S-C-T probe. The data are reported in practical salinity units (PSU). The TOC and DOC samples were analyzed using a High Temperature Catalytic Oxidation (HTCO) method. The instrument is specially equipped with high-salt sample combustion tube kit and halogen scrubber for seawater analysis. Seawater samples were acidified to pH <2 by concentrated hydrochloric acid (trace metal grade, Fisher Chemical) prior to analysis then sparged for 2 minutes to remove inorganic carbon (IC). The non-purgeable organic carbons (NPOC) in samples were further converted to CO_2 by oxidation at 680°C with a platinum catalyst. A non-dispersive infrared detector (NDIR) was used to detect the converted CO_2 for quantification of NPOC. The data are reported as both mg/L and µM.

HOLDING TIMES: All samples were analyzed within the established holding times of 90 days for Hg, six months for all other metals, and 7 days between collection and filtration for TSS.

DETECTION LIMITS: Laboratory method detection limits (MDLs) for seawater are reported from the Annually Verified Seawater MDL Study as determined by seven replicates of Sequim Bay Seawater spiked at an appropriate concentration for each analyte. The freshwater MDL was reported from the Annually Verified Freshwater MDL Study determined using seven replicates of deionized water prepared using the TRM preparation. Reporting limits are determined as 3.18 times the laboratory achieved MDL. The data are evaluated and flagged as follows:

U Analyte not detected at or above the MDL, MDL reported
J Analyte detected above the MDL, but less than the RL
N Spiked sample recovery outside QC criterion of 70-130%

& Accuracy result outside QC criterion of ≤20% PD
* Precision result outside QC criterion of <30%
B Analyte detected in the method blank > RL and sample concentration < 10 times detected blank value
c Exceeds data quality objective but meets one of the following contingency criterion:
  1 SRM certified <10x MDL or
  2 Insufficient spiking level relative to native sample concentrations
b Result is reagent blank corrected using the batch specific blank (BMRB)

METHOD BLANKS: A minimum of three method blanks were analyzed by each instrument with each analytical batch for metals. The average method blank for each batch was less than the RL for all metals except Zn. The seawater preconcentration procedure required to remove salt interferences prior to ICP-MS analyses includes the addition of chelating agents to induce precipitation of metals under specific conditions, as discussed in the method section above. The Zn data were evaluated and qualified with a "B" if the sample concentration was less than ten times the mean detected blank and the blank was above the RL. Five samples were qualified in the 072214DRC batch. The data are not considered impacted as the total and dissolved pairs do not indicate significant contamination.

The method blank for TSS is a polycarbonate filter (Nucleopore) taken through the analytical process with each batch of samples. The blanks were all less than the MDL.

The method blanks for TOC and DOC was deionized water. In addition, low carbon water (LCW) purchased from University of Miami was analyzed as part of the HTCO calibration curve to demonstrate that the instrumentation was not contributing carbon.

LABORATORY CONTROL SAMPLES: A minimum of one LCS (OPR or blank spike) was prepared and analyzed with each analytical batch of 20 or fewer samples for metals. Percent recoveries for LCS samples were within the QC acceptance criterion of 70% to 130% for all metals. The LCS matrix for the seawater samples was Sequim Bay Seawater prepared as both spiked and unspiked samples (e.g. SB LCS and SB Blank, respectively).

MATRIX SPIKE ACCURACY: A minimum of one set of duplicate matrix spikes (MS/MSD) was prepared and analyzed with each analytical batch of 20 or fewer samples for metals. Percent recoveries for matrix spikes were within the QC limits of 70% to 130% for all metals spiked at an appropriate level relative to the native sample concentration. Sample 1340 contained a native sample concentration of 26 ppb for Al and was spiked at 5 ppb. The data are not flagged as they meet the contingency criteria for the unsufficient spiking level. Alternate LCS and MS/MSD samples demonstrated acceptable accuracy and precision for Al in this seawater matrix. No additional actions were required.

REPLICATE PRECISION: Laboratory precision was expressed as the relative percent difference (RPD) between laboratory duplicates. The RPD values for the laboratory duplicates were within the QC acceptance criterion of ±30% for all parameters detected above the RL except one set for Al (32%), Pb (76%), and Zn (139%). Acceptable precision was demonstrated throughout the data set; results were flagged and no additional action taken.

STANDARD REFERENCE MATERIAL ACCURACY: Standard reference materials (SRM) were prepared and analyzed with each analytical batch at a minimum frequency of 1 per 20 or fewer samples. Analytical accuracy was expressed as the percent difference (PD) between the measured and the certified value. The SRM for Hg was 1641d, a freshwater SRM, as no seawater SRM was available. The PDs were within the QC acceptance criterion of ≤ 20%.

QA/QC NARRATIVE

Two SRMs were analyzed with the analytical batches for Al, Cd, Cr, Cu, Ni, Pb, and Zn quantified by ICP-MS. The freshwater SRM 1640a demonstrated analytical accuracy for each batch analyzed by ICP-MS and the freshwater sample matrices (e.g. outfall 021). Percent recoveries were within the QC acceptance criterion. There were no seawater SRMs for Al. High purity standards and the freshwater SRM were used to evaluate analytical accuracy.

CASS-5 is a seawater SRM analyzed with each ICP-MS batch. The PDs were within the QC criterion for all metals except Cr. The SRM is certified less than 10 times the MDL and meets the contingency criterion. The data are flagged with a "c". The alternate seawater SRM, SLEW-3, demonstrated acceptable analytical accuracy for Cr.

The SRM Copenhagen Water was used to verify the accuracy of the salinity measurements. The accuracy was 0.0-6.3% PD for all salinity measurements. There are no SRMs available for TOC or DOC. University of Miami provides a laboratory consensus value for DOC in estuarine water http://yyy.rsmas.miami.edu/groups/biogeochem/CRM.html The average of the reference value range was used to calculate the PD for each replicate. The PD ranged from 0.1 to 9.1%.

ALS ENVIRONMENTAL

Client:	Battelle	**Service Request No.:**	K1405950
Project:	ENVVEST June 2014 AMB 15	**Date Received:**	6/13/14
Sample Matrix:	Water		

Case Narrative

All analyses were performed consistent with the quality assurance program of ALS Environmental. This report contains analytical results for samples designated for Tier IV validation deliverables including summary forms and all of the associated raw data for each of the analyses. When appropriate to the method, method blank results have been reported with each analytical test.

Sample Receipt

Forty three water samples were received for analysis at ALS Environmental on 6/13/14. The samples were received in good condition and consistent with the accompanying chain of custody form. The samples were stored in a refrigerator at 4ºC upon receipt at the laboratory.

General Chemistry Parameters

No anomalies associated with this analysis were observed.

Results flagged with an asterisk (*) indicate values outside control criteria.

Results flagged with a pound (#) indicate the control criteria is not applicable.

Percent recoveries and relative percent differences (RPD) are determined by the software using values in the calculation which have not been rounded.

Results flagged with an asterisk (*) indicate values outside control criteria.

Results flagged with a pound (#) indicate the control criteria is not applicable.

Percent recoveries and relative percent differences (RPD) are determined by the software using values in the calculation which have not been rounded.

Project:	ENVVEST June 2014 AMB 15	**Date Collected:**	06/11/14
Sample Matrix:	Ocean Water	**Date Received:**	06/13/14
		Date Analyzed:	06/19/14
		Date Extracted:	NA

Matrix Spike Summary
Ammonia as Nitrogen

Sample Name:	AMB15-113/M5 DUP	**Units:**	mg/L
Lab Code:	K1405950-041	**Basis:**	NA
Analysis Method:	SM 4500-NH3 E		
Prep Method:	None		

Matrix Spike
K1405950-041MS

Analyte Name	Sample Result	Result	Spike Amount	% Rec	% Rec Limits
Ammonia as Nitrogen	0.066	9.85	10.0	98	80-115

Results flagged with an asterisk (*) indicate values outside control criteria.

Results flagged with a pound (#) indicate the control criteria is not applicable.

Percent recoveries and relative percent differences (RPD) are determined by the software using values in the calculation which have not been rounded.

LOG-IN CHECKLIST

Reference SOP# MSL-A-001

Central File #: 3106 Sample No(s): 1282- 1335 Batch: 36

Project Name: AMB 15 DAT Project Manager: JMB

TO BE COMPLETED BY PROJECT MANAGER (prior to arrival when possible)

Matrix: WAT WP#

Yes	No	
☐	☐	Navy-type Project (requires high-level sample tracking procedures)
☐	☐	USDA Samples (see Compliance Agreement Checklist)

PM Verification:

☐	☐	Filter Samples: *Amount:* Entire sample Half of sample
☐	☐	Freeze dry sample(s) - samples will be weighed and placed in ultralow temp freezer (Login Lab)
☐	☐	Special instructions:

Sample Preservation Instructions:

See LIMS for archive/disposal information

TO BE COMPLETED UPON SAMPLE ARRIVAL/LOG-IN

Yes	No	N/A	Indicate in Appropriate Box
☐	☐	☑	Custody seal present hand delivered by staff Seal intact? YES NO
☑	☐	☐	Cooler temperature (acceptable range: 4±2°C or solids:frozen) (if multiple coolers, note temp. of each)
☐	☐	☑	Project Manager notified of any custody/login discrepancies (cooler temp, sponsor codes, etc) 6/11/14
☑	☐	☐	Were all chain of custody forms signed and dated?
☑	☐	☐	Were samples filtered at MSL? as noted T/D pairs

Samples held 4±2°C until delivered & stored in Walkin cooler until filtering 6/11/14

Comment/Remedy:

Sample condition(s): (Acceptable) Other (explain):

Container type: Teflon (Poly) Glass Cap Vial Other:

Not NUT/TSS/DSPN <0.6: TOC/DOC

Notes: delivered to MSL

Completed By: Date/Time: 6/10/14 1830

SAMPLE PRESERVATION

☐	Sample(s) were preserved prior to arrival at MSL (noted on CoC / Sample / per PM Instruction)
☐	Random pH checked for ~10% of samples (use dip paper) Sample IDs:
☐	Complete pH check required for project (use pH meter and record on pH Record form)
☐	Sample(s) were preserved at MSL

Type:	☑	0.2% HNO3	Notes: Metals Lot#
	☐	0.5% HCl (Hg samples)	Notes: Lot#
	☑	Refrigerate/Freeze	Notes: NUT/0.6/TSS/DSPN = Refrigerator TOC/DOC freezer after filtering
	☐	Other	Notes:

Completed By: Date/Time: 6/11/14

Storage Shelf: Lab 231 (west) Walkin for refrigerated items Deep freezer for TOC/DOC

SAMPLE CHAIN OF CUSTODY FORM
Date: 6/11/2014 AMBIS DAY2
Page: 1 of 1
COC Number:

Battelle
Marine Sciences Laboratory
1529 West Sequim Bay Road
Sequim, Washington 98382

LOG-IN CHECKLIST

Reference SOP# MSL-A-001

Central File #: 3106 Sample No(s): ~~1336~~ 1339 - 1367 Batch: 37

Project Name: AMB15 DRY2 Project Manager: JMB

TO BE COMPLETED BY PROJECT MANAGER (prior to arrival when possible)

Matrix: WAT WP#

Yes	No	
☐	☐	Navy-type Project (requires high-level sample tracking procedures)
☐	☐	USDA Samples (see Compliance Agreement Checklist)

PM Verification:

☐	☐	Filter Samples:	Amount: Entire sample Half of sample
☐	☐	Freeze dry sample(s) - samples will be weighed and placed in ultralow temp freezer (Login Lab)	
☐	☐	Special instructions:	

Sample Preservation Instructions:

See LIMS for archive/disposal information

TO BE COMPLETED UPON SAMPLE ARRIVAL/LOG-IN

Yes	No	N/A	Indicate in Appropriate Box
☐	☐	☑	Custody seal present Seal intact? YES NO
☐	☐	☑	Cooler temperature (acceptable range: 4±2°C or solids:frozen) (if multiple coolers, note temp. of each)
☐	☐	☑	Project Manager notified of any custody/login discrepancies (cooler temp, sponsor codes, etc)
☑	☐	☐	Were all chain of custody forms signed and dated?
☑	☐	☐	Were samples filtered at MSL?

Samples were hand delivered to MSL, kept @ 4±2°C ~~then stored in walk-in refrig until filtered~~ 5

°C

Comment/Remedy:

Sample condition(s): (Acceptable) Other (explain):

Container type: (Teflon) (Poly) ~~Glass~~ TSS/OSAL/NUT Cap. Vial Other:

Notes: WP not on CoC - added MCF TOC/DOC

Completed By: Date/Time: 6/11/14 1730

SAMPLE PRESERVATION

☐		Sample(s) were preserved prior to arrival at MSL (noted on CoC / Sample / per PM Instruction)		
☐		Random pH checked for ~10% of samples (use dip paper)	Sample IDs:	
☐		Complete pH check required for project (use pH meter and record on pH Record form)		
☐		Sample(s) were preserved at MSL		
Type:	☑	0.2% HNO3	Notes: Metals	Lot#
	☐	0.5% HCl (Hg samples)	Notes:	Lot#
	☑	Refrigerate/Freeze	Notes: NUT/TSS/OSAL = refrigerator TOC/DOC = freezer	
	☐	Other	Notes:	

Completed By: Date/Time: 6/11/14 1740

Storage Shelf: Lab 231 = Mat j Walk-in for refrigerated Deep Freezer for TOC/DOC

Data Qualifiers
Ambient Monitoring - AMB16
ENVVEST Sept 2014

DATA QUALIFIERS:

c	Exceeds DQO but meets contingency criteria of either:
1	SRM certified <10x MDL
2	Insufficient spiking level relative to native sample concentrations
U	Analyte not detected at or above the MDL, MDL reported
J	Analyte detected above the MDL, but less than the RL
--	Not analyzed
NA	Not applicable/available
N	Spiked sample recovery outside QC criterion of 70-130%
NC	Not Certified
&	Accuracy result outside QC criterion of ≤20% PD
*	Precision result outside QC criterion of <30%
NS	Sample not spiked for this analyte
B	Analyte detected in the method blank > RL
	and sample concentration < 10 times detected blank value
b	Data are blank corrected using the batch specific procedural blank
[1]	Reported from the nucleopore filtration method instead of GF/C filters
[2]	Seawater DOC CRM (LOT#03-12) and low carbon water (LCW) were purchased from University of Miami http://yyy.rsmas.miami.edu/groups/biogeochem/CRM.html
[3]	Sample bottle cracked, no data reported
[4]	The laboratory DI water was found to be elevated in OC. The samples were not impacted by the DI water issue. See the QC narrative for more discussion.
HTCO	High Temperature Catalytic Oxidation

QA/QC NARRATIVE

PROJECT: Sinclair and Dyes Inlet Ambient Monitoring, September 2014 (AMB16)

PARAMETER: Total and Dissolved Metals – Al, Cd, Cr, Cu, Ni, Pb, Zn, Hg
Total Suspended Solids (TSS), Salinity (OSAL), Dissolved Organic Carbon (DOC), and Total Organic Carbon (TOC)

LABORATORY: Battelle Marine Sciences Laboratory (MSL), Sequim, Washington

MATRIX: Seawater and Freshwater

SAMPLE CUSTODY AND PROCESSING: Samples were collected from Sinclair and Dyes Inlet region by MSL and the U.S. Navy on 9/16/2014 and 09/17/2014. Samples were hand delivered to MSL by the field team. All samples were received in good condition. Samples were assigned a Battelle Central File (CF) identification number (3106) and were entered into Battelle's sample tracking system. Upon receipt at MSL, the samples designated for total and dissolved metals (TME/DME) were shaken vigorously and approximately 500mL was filtered through a pre-cleaned 0.45µm polyvinylidene fluoride (PVDF) filter membrane inside a class 100 clean bench and the filtrate was transferred to a trace metal clean Teflon bottle. The dissolved and total fractions were each acidified to a pH of < 2.0 with double distilled nitric acid. The samples for TSS and OSAL were stored at 4.0±2°C in low density polyethylene bottles prior to analysis. The samples for TOC and DOC were collected in pre-cleaned glass and stored at -20°C until analyses.

The following lists information on sample receipt and processing activities:

Sample Receipt Dates:	09/16/2014 and 09/17/2014 EQP BLKS 08/15/2014
Cooler temp. on arrival	All coolers were at 4.0±2°C
Collection dates	See Table
TSS analysis dates	09/22/14 and 09/23/14
OSAL analysis dates	09/21/14
CVAF analysis dates (Hg)	10/09/14, 10/10/14, 10/14/14, 10/16/14, and 10/22/14
TRM Prep/Freshwater Analysis by ICP-MS (Al, Cd, Cr, Cu, Ni, Pb, Zn)	09/26/14
Fe/Pd Preconcentration Seawater Analysis by ICP-MS (Al, Cd, Cr, Cu, Ni, Pb, Zn)	09/29/14, 10/01/14, 10/08/14
TOC/DOC Analysis Date	10/13/14 through 10/16/14

QA/QC NARRATIVE

QA/QC DATA QUALITY OBJECTIVES FOR SEAWATER SAMPLES:

Mercury	CVAF	70-130%	≤20%	≤30%	0.1 ng/L	0.32 ng/L

METHODS:

Seawater samples were analyzed for eight metals: aluminum (Al), cadmium (Cd), chromium (Cr), copper (Cu), nickel (Ni), lead (Pb), zinc (Zn), and mercury (Hg). Samples were submitted for analyses by two methods. Both freshwater and seawater samples were analyzed for Hg by Cold Vapor Atomic Fluorescence (CVAF) in accordance with Battelle SOP *MSL-I-013*, *Total Mercury in Aqueous Samples by CVAF*, following EPA Method 1631 revision E. The Hg data are reported in ng/L.

Seawater samples were analyzed for all other metals using a preconcentration via a precipitation step followed by reconstitution in a salt free solution in accordance with Battelle SOP *MSL-I-025, Methods of Sample Preconcentration: Iron and Palladium/APDC Coprecipitation and Borohydride (Fe/Pd) Reductive Precipitation for Trace Metals Analysis in Water.* Preconcentrated seawater samples were analyzed by Inductively Coupled Plasma-Mass Spectrometry (ICP-MS) in accordance with Battelle SOP *MSL-I-022, Determination of Elements in Aqueous and Digestate Samples by ICP/MS.* The base methods for this procedure are EPA Method 1638 and

METHODS (cont): EPA Method 1640.

Freshwater samples identified as < 5% seawater were analyzed for all metals, except Hg, by ICP-MS following the preparation method for total recoverable metals (TRM) described in EPA Method 1640. The analysis for Hg does not require a different method for freshwater versus saltwater.

The ICP-MS data were reported in units of µg/L. The required preconcentration procedure for seawater samples analyzed by ICP-MS includes the addition of chelating agents to induce precipitation of metals under specific conditions. Subsequently, reagents added to the samples should be of the purest quality to result in zero addition of metals to the seawater samples. Required reagents have trace impurities of these metals; therefore, the data are blank corrected for these elements. In previous AMB data sets, the mean reagent blank for each analytical batch was subtracted from the reported sample concentration after the analyses were completed and data were qualified with a "b". The new ICP-MS analytical method includes a matrix matching procedure that allows the quantification of the small concentrations of metals added to the samples during the Fe/Pd preparation to be subtracted from the sample during the analyses. The correction of the data allows it to be directly compared to all previous AMB events, but does not require the addition of the "b" data qualifier to the ICP-MS data.

The TSS samples were analyzed following SM2540Dmod using a gravimetric analysis. The modification occurs in the use of a polycarbonate filter versus a glass fiber filter. A comparison between the glass fiber filters (GF/C) and the polycarbonate was conducted on AMB10 and AMB11. In almost all cases the GF/C filters over estimated the TSS concentration. The SOP has been modified to reflect the changes in the type of filter used for isolation of the TSS. No other changes were made to the standard method protocol. The data are reported in units of mg/L.

The OSAL samples were measured using a YSI-30 S-C-T probe. The data are reported in practical salinity units (PSU). The TOC and DOC samples were analyzed using a High Temperature Catalytic Oxidation (HTCO) method. The instrument is specially equipped with high-salt sample combustion tube kit and halogen scrubber for seawater analysis. Seawater samples were acidified to pH <2 by concentrated hydrochloric acid (trace metal grade, Fisher Chemical) prior to analysis then sparged for 2 minutes to remove inorganic carbon (IC). The non-purgeable organic carbons (NPOC) in samples were further converted to CO_2 by oxidation at 680°C with a platinum catalyst. A non-dispersive infrared detector (NDIR) was used to detect the converted CO_2 for quantification of NPOC. The data are reported as both mg/L and µM.

HOLDING TIMES: All samples were analyzed within the established holding times of 90 days for Hg, six months for all other metals, and 7 days between collection and filtration for TSS.

DETECTION LIMITS: Laboratory method detection limits (MDLs) for seawater are reported from the Annually Verified Seawater MDL Study as determined by seven replicates of Sequim Bay Seawater spiked at an appropriate concentration for each analyte. The freshwater MDL was reported from the Annually Verified Freshwater MDL Study determined using seven replicates of deionized water prepared using the TRM preparation. Reporting limits are determined as 3.18 times the laboratory achieved MDL. The data are evaluated and flagged as follows:

U Analyte not detected at or above the MDL, MDL reported
J Analyte detected above the MDL, but less than the RL
N Spiked sample recovery outside QC criterion of 70-130%
& Accuracy result outside QC criterion of ≤20% PD

* Precision result outside QC criterion of <30%
B Analyte detected in the method blank > RL and sample concentration < 10 times detected blank value
c Exceeds data quality objective but meets one of the following contingency criterion:
  1 SRM certified <10x MDL or
  2 Insufficient spiking level relative to native sample concentrations

METHOD BLANKS: A minimum of three method blanks were analyzed by each instrument with each analytical batch for metals. The average method blank for each batch was less than the RL for all metals except Zn. The seawater preconcentration procedure required to remove salt interferences prior to ICP-MS analyses includes the addition of chelating agents to induce precipitation of metals under specific conditions, as discussed in the method section above. The Zn data were evaluated and qualified with a "B" if the sample concentration was less than ten times the mean detected blank and the blank was above the RL. Sixteen samples were qualified in the 100214A-DRC batch. The data are not considered impacted as the overall Zn concentration is low and less than 10 times the RL.

The method blank for TSS is a polycarbonate filter (Nucleopore) taken through the analytical process with each batch of samples. The blanks were all less than the MDL.

The method blanks for TOC and DOC were deionized water and all below the RL. In addition, low carbon water (LCW) purchased from University of Miami was analyzed as part of the HTCO calibration curve to demonstrate that the instrumentation was not contributing carbon.

LABORATORY CONTROL SAMPLES: A minimum of one LCS (OPR or blank spike) was prepared and analyzed with each analytical batch of 20 or fewer samples for metals. Percent recoveries for LCS samples were within the QC acceptance criterion of 70% to 130% for all metals. The LCS matrix for the seawater samples was Sequim Bay Seawater prepared as both spiked and unspiked samples (e.g. SB LCS and SB Blank, respectively).

MATRIX SPIKE ACCURACY: A minimum of one set of duplicate matrix spikes (MS/MSD) was prepared and analyzed with each analytical batch of 20 or fewer samples for metals. Percent recoveries for matrix spikes were within the QC limits of 70% to 130% for all metals spiked at an appropriate level relative to the native sample concentration. Sample 3106-1410 and -1412 contained a high native sample concentration for Al and were not spiked at a sufficient level. The data are not flagged as they meet the contingency criteria for the unsufficient spiking level (see "c" flag). Alternate LCS and MS/MSD samples demonstrated acceptable accuracy and precision for Al in this seawater matrix. No additional actions were required.

REPLICATE PRECISION: Laboratory precision was expressed as the relative percent difference (RPD) between laboratory duplicates. The RPD values for the laboratory duplicates were within the QC acceptance criterion of ±30% for all parameters detected above the RL except one set for Ni (108%). Acceptable precision was demonstrated throughout the data set; results were flagged and no additional action taken.

STANDARD REFERENCE MATERIAL ACCURACY: Standard reference materials (SRM) were prepared and analyzed with each analytical batch at a minimum frequency of 1 per 20 or fewer samples. Analytical accuracy was expressed as the percent difference (PD) between the measured and the certified value. The SRM for Hg was 1641d, a freshwater SRM, as no seawater SRM was available. The PDs were within the QC acceptance criterion of ≤ 20%.

QA/QC NARRATIVE

Two SRMs were analyzed with the analytical batches for Al, Cd, Cr, Cu, Ni, Pb, and Zn quantified by ICP-MS. The freshwater SRM 1640a demonstrated analytical accuracy for each batch analyzed by ICP-MS and the freshwater sample matrices (e.g. outfall 021). Percent recoveries were within the QC acceptance criterion. There is no seawater SRM for Al. High purity standards and the freshwater SRM were used to evaluate analytical accuracy.

CASS-5 and SLEW-3 are seawater SRMs analyzed with each ICP-MS batch. The SRMs are only considered for data set evaluation if they are certified greater than 10 times the MDL; data where certified values less than 10 times the MDL are flagged with a "c". The PDs were within the QC criterion for all metals except one replicate of CASS-5 for Zn. The alternate SRM was acceptable and no additional action was taken.

The SRM Copenhagen Water was used to verify the accuracy of the salinity measurements. The accuracy was 0.8-2.5% PD for all salinity measurements.

There are no SRMs available for TOC or DOC. University of Miami provides a laboratory consensus value for DOC in estuarine water http://yyy.rsmas.miami.edu/groups/biogeochem/CRM.html The average of the reference value range was used to calculate the PD for each replicate. The PDs ranged from 0.1 to 6.8%.

ALS ENVIRONMENTAL

Client:	Battelle Marine Sciences Lab	**Service Request No.:**	K1410140
Project:	SEPT 2014 Ambient Monitoring (AMB 16)	**Date Received:**	09/19/14
Sample Matrix:	Ocean Water and Water		

Case Narrative

All analyses were performed consistent with the quality assurance program of ALS Environmental. This report contains analytical results for samples designated for Tier IV validation deliverables including summary forms and all of the associated raw data for each of the analyses. When appropriate to the method, method blank results have been reported with each analytical test.

Sample Receipt

Forty-four samples were received for analysis at ALS Environmental on 09/19/14. The samples were received in good condition and consistent with the accompanying chain of custody form, except where noted on the cooler receipt and preservation form included in this report. The samples were stored in a refrigerator at 4ºC upon receipt at the laboratory.

General Chemistry Parameters

Phosphorus, Total by Method 365.3:
The Relative Percent Difference (RPD) criterion for the replicate analysis in sample AMB16-001/PS03 was not applicable because the analyte concentration was not significantly greater than the Method Reporting Limit (MRL). Analytical values derived from measurements close to the detection limit are not subject to the same accuracy and precision criteria as results derived from measurements higher on the calibration range for the method.

No other anomalies associated with the analysis of these samples were observed.

Results flagged with an asterisk (*) indicate values outside control criteria.

Results flagged with a pound (#) indicate the control criteria is not applicable.

Percent recoveries and relative percent differences (RPD) are determined by the software using values in the calculation which have not been rounded.

Results flagged with an asterisk (*) indicate values outside control criteria.

Results flagged with a pound (#) indicate the control criteria is not applicable.

Percent recoveries and relative percent differences (RPD) are determined by the software using values in the calculation which have not been rounded.

DAY 1

LOG-IN CHECKLIST

Reference SOP# MSL-A-001

Central File #: 3106 Sample No(s): 1374-1429 Batch: 40

Project Name: ENVEST AMB16 Project Manager: JMB

TO BE COMPLETED BY PROJECT MANAGER (prior to arrival when possible)

Matrix: WAT WP#

Special Instructions:

See LIMS Sample Tracking for archive/disposal information

TO BE COMPLETED UPON SAMPLE ARRIVAL/LOG-IN

Yes	No	N/A	Indicate in Appropriate Box
		✓	Custody seal present Seal intact? YES NO
		✓	Cooler temperature (acceptable range: less than 6°C or solids:frozen) (if multiple coolers, note temp. of each cooler) 4±2°C
		✓	Project Manager notified of any custody/login discrepancies (cooler temp, sponsor codes, etc)
✓			Were all chain of custody forms signed and dated?
✓			Were samples filtered at MSL? ALL HALF

Samples hand delivered to LAB from field by MSL staff.

Cooler 1: °C
Cooler 2: °C
Cooler 3: °C
Cooler 4: °C

Comment/Remedy:

Samples must be filtered prior to preservation!

Sample condition(s): Acceptable Other (explain):

Container type: Teflon Poly Glass Cap. Vial Baggie Other:

Notes:

Completed By: C. Susuki 9/17/14 @ Login Cooler Receipt Date/Time: 9/16/14 2000

to maintain until login of

SAMPLE PRESERVATION

	Sample(s) were preserved prior to arrival at MSL (noted on: CoC / Sample / per PM Instruction)			
	Random pH checked for ~10% of samples (use dip paper)	Sample IDs:		
	Complete pH check required for project (use pH meter and record on pH Record form)			
	Sample(s) were preserved at MSL			
Type: X	0.2% HNO3 Metals	Notes:	Lot#	
	0.5% HCl (Hg samples)	Notes:	Lot#	
X	Refrigerate/Freeze TOC DOC	Notes:	Walk-in frig / Deep freezer	
	Other TSS ISA / NOT	Notes:		

Completed By: Preservation Date/Time:

Storage Shelf: Metals: Lab 231 K-5-C, K-5-D,

Reference SOP# MSL-A-001

Central File #: 31002 Sample No(s): 1430-1465 Batch: 41

Project Name: AMB 16a (DAY2) Project Manager: Brandenberger

TO BE COMPLETED BY PROJECT MANAGER (prior to arrival when possible)

Matrix: Sea Water WP#

Special Instructions:

See LIMS Sample Tracking for archive/disposal information

TO BE COMPLETED UPON SAMPLE ARRIVAL/LOG-IN

Yes	No	N/A	Indicate in Appropriate Box
☐	☐	☑	Custody seal present Seal intact? YES NO
☑	☐	☐	Cooler temperature (acceptable range: less than 6°C or solids:frozen) (if multiple coolers, note temp. of each cooler)
☐	☐	☑	Project Manager notified of any custody/login discrepancies (cooler temp, sponsor codes, etc)
☑	☐	☐	Were all chain of custody forms signed and dated?
☑	☐	☐	Were samples filtered at MSL? ALL HALF TM2

Cooler 1: 4 °C
Cooler 2: °C
Cooler 3: °C
Cooler 4: °C

Comment/Remedy:

Samples must be filtered prior to preservation!

Sample condition(s): Acceptable Other (explain):

Container type: ~~Teflon~~ ~~Poly~~ Glass Cap. Vial Baggie Other:

Notes:

Completed By: STRW Cooler Receipt Date/Time: 20140917 1700

SAMPLE PRESERVATION

☐ Sample(s) were preserved prior to arrival at MSL (noted on: CoC / Sample / per PM Instruction)

☐ Random pH checked for ~10% of samples (use dip paper) Sample IDs:

☐ Complete pH check required for project (use pH meter and record on pH Record form)

☑ Sample(s) were preserved at MSL

Type: ☑ 0.2% HNO3 TM2 Notes: By Jordi Lot# 121200

☐ 0.5% HCl (Hg samples) Notes: Lot#

☑ Refrigerate/Freeze Notes: RCF: Nutrients & OSAL, FR: TOC/DOC

☐ Other Notes:

Completed By: STRW Preservation Date/Time: 20140917 1700

QA/QC NARRATIVE

PROJECT: Sinclair and Dyes Inlet Ambient Monitoring, April 2015 (AMB17)

PARAMETER: Total and Dissolved Metals – Al, Cd, Cr, Cu, Ni, Pb, Zn, Hg
Total Suspended Solids (TSS), Salinity (OSAL), Dissolved Organic Carbon (DOC), and Total Organic Carbon (TOC)

LABORATORY: Battelle Marine Sciences Laboratory (MSL), Sequim, Washington

MATRIX: Seawater and Freshwater

SAMPLE CUSTODY AND PROCESSING: Samples were collected from Sinclair and Dyes Inlet region by MSL and the U.S. Navy on 04/07/2015 and 04/08/2015. Samples were hand delivered to MSL by the field team. All samples were received in good condition. Samples were assigned a Battelle Central File (CF) identification number (3106) and were entered into Battelle's sample tracking system. Upon receipt at MSL, the samples designated for total and dissolved metals (TME/DME) were shaken vigorously and approximately 500mL was filtered through a pre-cleaned 0.45µm polyvinylidene fluoride (PVDF) filter membrane inside a class 100 clean bench and the filtrate was transferred to a trace metal clean Teflon bottle. The dissolved and total fractions were each acidified to a pH of < 2.0 with double distilled nitric acid. The samples for TSS and OSAL were stored at 4.0±2°C in low density polyethylene bottles prior to analysis. The samples for TOC and DOC were collected in pre-cleaned glass and stored at -20°C until analyses.

The following lists information on sample receipt and processing activities:

Sample Receipt Dates:	04/07/15 and 04/08/15
Cooler temp. on arrival	All coolers were at 4.0±2°C
Collection dates	See Table
TSS analysis dates	04/08/15 and 04/11/15
OSAL analysis dates	04/08/15 and 04/10/15
CVAF analysis dates (Hg)	05/06/15, 05/14/15, 05/15/15, 05/18/15, 05/20/15, 05/21/15, and 05/28/15
TRM Prep/Freshwater Analysis by ICP-MS (Al, Cd, Cr, Cu, Ni, Pb, Zn)	06/05/15
Fe/Pd Preconcentration Seawater Analysis by ICP-MS (Al, Cd, Cr, Cu, Ni, Pb, Zn)	05/28/15 and 06/03/15
TOC/DOC Analysis Date	04/28/15 through 05/04/15

QA/QC DATA QUALITY OBJECTIVES FOR SEAWATER SAMPLES:

Analyte	Analytical Method for Seawater	MS Range of Recovery	SRM Percent Difference	Replicate Precision	Method Detection Limits	Reporting Limits

Mercury	CVAF	70-130%	≤20%	≤30%	0.10 ng/L	0.32 ng/L

METHODS:

Seawater samples were analyzed for eight metals: aluminum (Al), cadmium (Cd), chromium (Cr), copper (Cu), nickel (Ni), lead (Pb), zinc (Zn), and mercury (Hg). Samples were submitted for analyses by two methods. Both freshwater and seawater samples were analyzed for Hg by Cold Vapor Atomic Fluorescence (CVAF) in accordance with Battelle SOP *MSL-I-013*, *Total Mercury in Aqueous Samples by CVAF*, following EPA Method 1631 revision E. The Hg data are reported in ng/L.

Seawater samples were analyzed for all other metals using a preconcentration via a precipitation step followed by reconstitution in a salt free solution in accordance with Battelle SOP *MSL-I-025, Methods of Sample Preconcentration: Iron and Palladium/APDC Coprecipitation and Borohydride (Fe/Pd) Reductive Precipitation for Trace Metals Analysis in Water.* Preconcentrated seawater samples were analyzed by Inductively Coupled Plasma-Mass Spectrometry (ICP-MS) in accordance with Battelle SOP *MSL-I-022, Determination of Elements in Aqueous and Digestate Samples by ICP/MS.* The base methods for this procedure are EPA Method 1638 and

METHODS (cont): EPA Method 1640.

Freshwater samples identified as < 5% seawater were analyzed for all metals, except Hg, by ICP-MS following the preparation method for total recoverable metals (TRM) described in EPA Method 1640. The analysis for Hg does not require a different method for freshwater versus saltwater.

The ICP-MS data were reported in units of µg/L. The required preconcentration procedure for seawater samples analyzed by ICP-MS includes the addition of chelating agents to induce precipitation of metals under specific conditions. Subsequently, reagents added to the samples should be of the purest quality to result in zero addition of metals to the seawater samples. Required reagents have trace impurities of these metals; therefore, the data are blank corrected for these elements. In previous AMB data sets, the mean reagent blank for each analytical batch was subtracted from the reported sample concentration after the analyses were completed and data were qualified with a "b". The new ICP-MS analytical method includes a matrix matching procedure that allows the quantification of the small concentrations of metals added to the samples during the Fe/Pd preparation to be subtracted from the sample during the analyses. The correction of the data allows it to be directly compared to all previous AMB events, but does not require the addition of the "b" data qualifier to the ICP-MS data.

The TSS samples were analyzed following SM2540Dmod using a gravimetric analysis. The modification occurs in the use of a polycarbonate filter versus a glass fiber filter. A comparison between the glass fiber filters (GF/C) and the polycarbonate was conducted on AMB10 and AMB11. In almost all cases the GF/C filters over estimated the TSS concentration. The SOP has been modified to reflect the changes in the type of filter used for isolation of the TSS. No other changes were made to the standard method protocol. The data are reported in units of mg/L.

The OSAL samples were measured using a YSI-30 S-C-T probe. The data are reported in practical salinity units (PSU). The TOC and DOC samples were analyzed using a High Temperature Catalytic Oxidation (HTCO) method. The instrument is specially equipped with high-salt sample combustion tube kit and halogen scrubber for seawater analysis. Seawater samples were acidified to pH <2 by concentrated hydrochloric acid (trace metal grade, Fisher Chemical) prior to analysis then sparged for 2 minutes to remove inorganic carbon (IC). The non-purgeable organic carbons (NPOC) in samples were further converted to CO_2 by oxidation at 680°C with a platinum catalyst. A non-dispersive infrared detector (NDIR) was used to detect the converted CO_2 for quantification of NPOC. The data are reported as both mg/L and µM.

HOLDING TIMES: All samples were analyzed within the established holding times of 90 days for Hg, six months for all other metals, and 7 days between collection and filtration for TSS.

DETECTION LIMITS: Laboratory method detection limits (MDLs) for seawater are reported from the Annually Verified Seawater MDL Study as determined by seven replicates of Sequim Bay Seawater spiked at an appropriate concentration for each analyte. The freshwater MDL was reported from the Annually Verified Freshwater MDL Study determined using seven replicates of deionized water prepared using the TRM preparation. Reporting limits are determined as 3.18 times the laboratory achieved MDL. The data are evaluated and flagged as follows:

U Analyte not detected at or above the MDL, MDL reported
J Analyte detected above the MDL, but less than the RL
N Spiked sample recovery outside QC criterion of 70-130%
& Accuracy result outside QC criterion of ≤20% PD

* Precision result outside QC criterion of <30%
B Analyte detected in the method blank > RL and sample concentration < 10 times detected blank value
c Exceeds data quality objective but meets one of the following contingency criterion:
  1 SRM certified <10x MDL or
  2 Insufficient spiking level relative to native sample concentrations

METHOD BLANKS: A minimum of three method blanks were analyzed by each instrument with each analytical batch for metals. The average method blank for each batch was less than the RL for all metals.

The method blank for TSS is a polycarbonate filter (Nucleopore) taken through the analytical process with each batch of samples. The blanks were less than the MDL with the exception of two values, both less than three times the MDL.

The method blanks for TOC and DOC were deionized water and nineteen out of twenty results were below the RL. One result (MB6) was greater than the RL however field sample concentrations were more than 10x the detected blank; it is believed this elevated blank has no impact to reported field results. In addition, low carbon water (LCW) purchased from University of Miami was analyzed as part of the HTCO calibration curve to demonstrate that the instrumentation was not contributing carbon.

LABORATORY CONTROL SAMPLES: A minimum of one LCS (OPR or blank spike) was prepared and analyzed with each analytical batch of 20 or fewer samples for metals. Percent recoveries for LCS samples were within the QC acceptance criterion of 70% to 130% for all metals. The LCS matrix for the seawater samples was Sequim Bay Seawater prepared as both spiked and unspiked samples (e.g. SB LCS and SB Blank, respectively).

MATRIX SPIKE ACCURACY: A minimum of one set of duplicate matrix spikes (MS/MSD) was prepared and analyzed with each analytical batch of 20 or fewer samples for metals. Percent recoveries for matrix spikes were within the QC limits of 70% to 130% for all metals spiked at an appropriate level relative to the native sample concentration. The matrix spike for 3106-1563 was outside the QC criteria for Al and Zn. The data are flagged. No additional actions were required.

REPLICATE PRECISION: Laboratory precision was expressed as the relative percent difference (RPD) between laboratory duplicates. The RPD values for the laboratory duplicates were within the QC acceptance criterion of ±30% for all parameters detected above the RL.

STANDARD REFERENCE MATERIAL ACCURACY: Standard reference materials (SRM) were prepared and analyzed with each analytical batch at a minimum frequency of 1 per 20 or fewer samples. Analytical accuracy was expressed as the percent difference (PD) between the measured and the certified value. The SRM for Hg was 1641d, a freshwater SRM, as no seawater SRM was available. The PDs were within the QC acceptance criterion of ≤ 20%.

Two SRMs were analyzed with the analytical batches for Al, Cd, Cr, Cu, Ni, Pb, and Zn quantified by ICP-MS. The freshwater SRM 1640a demonstrated analytical accuracy for each batch analyzed by ICP-MS and the freshwater sample matrices (e.g. outfall 021) and seawater SRM CASS-5. Percent recoveries were within the QC acceptance criterion. There is no seawater SRM for Al. High purity standards and the freshwater SRM were used to evaluate analytical accuracy.

CASS-5 SRM was only considered for data set evaluation if the certified value was greater than 10 times the MDL. If the QC sample exceeded the criteria and the certified value for that element was less than 10 times the MDL then the data were

flagged with a “c”. The PDs were within the QC criterion for all metals except two replicate of CASS-5 for Pb and one for Zn. Accuracy for these elements was demonstrated by the alternate freshwater SRM, LCS and MS/MSD samples. Since the certified values for these elements are less than 10x the MDL, no further corrective actions were required.

The SRM Copenhagen Water was used to verify the accuracy of the salinity measurements. The accuracy was 1.1 to 2.9% PD for all salinity measurements.

There are no SRMs available for TOC or DOC. University of Miami provides a laboratory consensus value for DOC in estuarine water http://yyy.rsmas.miami.edu/groups/biogeochem/CRM.html The average of the reference value range was used to calculate the PD for each replicate. The PDs ranged from 0.1 to 6.8%.

ALS ENVIRONMENTAL

Client:	Battelle Marine Sciences Lab	**Service Request No.:**	K1503659
Project:	April 2015 Ambient Monitoring (AMB17)	**Date Received:**	04/09/15
Sample Matrix:	Ocean Water and Water		

Case Narrative

All analyses were performed consistent with the quality assurance program of ALS Environmental. This report contains analytical results for samples designated for Tier IV validation deliverables including summary forms and all of the associated raw data for each of the analyses. When appropriate to the method, method blank results have been reported with each analytical test.

Sample Receipt

Three samples were received for analysis at ALS Environmental on 04/09/15. The samples were received in good condition and consistent with the accompanying chain of custody form. The samples were stored in a refrigerator at 4ºC upon receipt at the laboratory.

General Chemistry Parameters

No anomalies associated with the analysis of these samples were observed.

Project:	ENVVEST AMB17	**Date Received:**	04/10/15
Sample Matrix:	Ocean Water and Water		

Case Narrative

All analyses were performed consistent with the quality assurance program of ALS Environmental. This report contains analytical results for samples designated for Tier IV validation deliverables including summary forms and all of the associated raw data for each of the analyses. When appropriate to the method, method blank results have been reported with each analytical test.

Sample Receipt

Forty-six ocean water and two water samples were received for analysis at ALS Environmental on 04/10/15. The samples were received in good condition and consistent with the accompanying chain of custody form. The samples were stored in a refrigerator at 4ºC upon receipt at the laboratory.

General Chemistry Parameters

Ammonia as Nitrogen by Standard Method 4500-NH3 E:
The Relative Percent Difference (RPD) criterion for the replicate analysis in sample M3.1 was not applicable because the analyte concentration was not significantly greater than the Method Reporting Limit (MRL). Analytical values derived from measurements close to the detection limit are not subject to the same accuracy and precision criteria as results derived from measurements higher on the calibration range for the method.

No other anomalies associated with the analysis of these samples were observed.

Results flagged with an asterisk (*) indicate values outside control criteria.

Results flagged with a pound (#) indicate the control criteria is not applicable.

Percent recoveries and relative percent differences (RPD) are determined by the software using values in the calculation which have not been rounded.

Results flagged with an asterisk (*) indicate values outside control criteria.

Results flagged with a pound (#) indicate the control criteria is not applicable.

Percent recoveries and relative percent differences (RPD) are determined by the software using values in the calculation which have not been rounded.

LOG-IN CHECKLIST

Reference SOP# MSL-A-001

Central File #: 3106 Sample No(s): 1474 - 1529 Batch: 43

Project Name: ENVVEST AMB 17 Project Manager: Brandenberger

TO BE COMPLETED BY PROJECT MANAGER (prior to arrival when possible)

Matrix: SeaWater WP# N427161

Special Instructions:

See LIMS Sample Tracking for archive/disposal information

TO BE COMPLETED UPON SAMPLE ARRIVAL/LOG-IN

Yes	No	N/A	Indicate in Appropriate Box
		✓	Custody seal present Seal intact? YES NO
✓			Cooler temperature (acceptable range: less than 6°C or solids:frozen) (if multiple coolers, note temp. of each cooler)
		✓	Project Manager notified of any custody/login discrepancies (cooler temp, sponsor codes, etc) Comment/Remedy:
✓			Were all chain of custody forms signed and dated?
✓			Were samples filtered at MSL? ALL HALF TIME *Samples must be filtered prior to preservation!*

Cooler 1: 4 °C
Cooler 2: 4 °C
Cooler 3: 4 °C
Cooler 4: 4 °C

Sample condition(s): (Acceptable) Other (explain):

Container type: (Teflon) (Poly) (Glass) (Cap. Vial) Baggie Other:

Notes:

Completed By: STRUSZ Cooler Receipt Date/Time: 20150407 2000

SAMPLE PRESERVATION

- [ ] Sample(s) were preserved prior to arrival at MSL (noted on: CoC / Sample / per PM Instruction)
- [ ] Random pH checked for ~10% of samples (use dip paper) Sample IDs:
- [ ] Complete pH check required for project (use pH meter and record on pH Record form)
- [x] Sample(s) were preserved at MSL

Type:
- [x] 0.2% HNO3 Notes: TMS - Lab Lot# 1214010
- [ ] 0.5% HCl (Hg samples) Notes: Lot#
- [x] Refrigerate/Freeze Notes: Refrig: TSS/OSAL, Nutr., O.I/grease 20150407 2000
- [ ] Other Notes: Freeze: TOC, DOC

Completed By: Preservation Date/Time: 4-8-15 8:00 AM

Storage Shelf:

Comments/Observations:

LOG-IN CHECKLIST

Reference SOP# MSL-A-001

Central File #: 3106 Sample No(s): 1529-1548 Batch: 46

Project Name: ENVVEST AMB 17 Project Manager: Brandenberger

TO BE COMPLETED BY PROJECT MANAGER (prior to arrival when possible)

Matrix: Sea Water WP# N427(e)

Special Instructions:

See LIMS Sample Tracking for archive/disposal information

TO BE COMPLETED UPON SAMPLE ARRIVAL/LOG-IN

Yes	No	N/A	Indicate in Appropriate Box		
		X	Custody seal present	Seal intact? YES NO	Cooler 1: 4 °C
X			Cooler temperature (acceptable range: less than 6°C or solids:frozen) (if multiple coolers, note temp. of each cooler)		Cooler 2: 4 °C Cooler 3: 4 °C Cooler 4: 4 °C
		X	Project Manager notified of any custody/login discrepancies (cooler temp, sponsor codes, etc)		

Comment/Remedy:

X			Were all chain of custody forms signed and dated?	
X			Were samples filtered at MSL?	ALL HALF TMT — *Samples must be filtered prior to preservation!*

Sample condition(s): Acceptable Other (explain):

Container type: Teflon Poly Glass Cap. Vial Baggie Other:

Notes:

Completed By: [signature] Cooler Receipt Date/Time: 20150708 1300

SAMPLE PRESERVATION

- [ ] Sample(s) were preserved prior to arrival at MSL (noted on: CoC / Sample / per PM Instruction)
- [ ] Random pH checked for ~10% of samples (use dip paper) Sample IDs:
- [ ] Complete pH check required for project (use pH meter and record on pH Record form)
- [X] Sample(s) were preserved at MSL

Type:		Notes:	Lot#
[X]	0.2% HNO3	TMT	1214010
[ ]	0.5% HCl (Hg samples)		
[X]	Refrigerate/Freeze	TSS/OSAL, Nutrients to refer	20150708 1300
[ ]	Other	TOC/DOC to deepfreeze	

Completed By: [signature] Preservation Date/Time: 4-9-15 8 AM

Cooler Receipt and Preservation Form

Client BATTELLE Service Request K15 03715

Received: 4/10/15 Opened: 4/10/15 By: [illegible] Unloaded: 4/10/15 By: [illegible]

1. Samples were received via? *Mail* (*Fed Ex*) *UPS* *DHL* *PDX* *Courier* *Hand Delivered*
2. Samples were received in: (circle) (*Cooler*) *Box* *Envelope* *Other*_____ *NA*
3. Were custody seals on coolers? NA Y (N) If yes, how many and where?_____
   If present, were custody seals intact? Y N If present, were they signed and dated? Y N

Raw Cooler Temp	Corrected. Cooler Temp	Raw Temp Blank	Corrected Temp Blank	Corr. Factor	Thermometer ID	Cooler/COC ID (NA)	Tracking Number NA	Filed
4.6	4.5	N/P	—	-0.1	334		773331543226	
3.3	3.4	N/P	—	0.1	342		773331543330	
3.5	3.5	N/P	—	0	327		773331543097	

4. Packing material: *Inserts* *Baggies* *Bubble Wrap* (*Gel Packs*) *Wet Ice* *Dry Ice* *Sleeves* _____
5. Were custody papers properly filled out (ink, signed, etc.)? NA (Y) N
6. Did all bottles arrive in good condition (unbroken)? *Indicate in the table below.* NA (Y) N
7. Were all sample labels complete (i.e analysis, preservation, etc.)? NA (Y) N
8. Did all sample labels and tags agree with custody papers? *Indicate major discrepancies in the table on page 2.* NA (Y) N
9. Were appropriate bottles/containers and volumes received for the tests indicated? NA (Y) N
10. Were the pH-preserved bottles (*see SMO GEN SOP*) received at the appropriate pH? *Indicate in the table below* NA (Y) N
11. Were VOA vials received without headspace? *Indicate in the table below.* (NA) Y N
12. Was C12/Res negative? (NA) Y N

Sample ID on Bottle	Sample ID on COC	Identified by:

Sample ID	Bottle Count Bottle Type	Out of Temp	Head-space	Broke	pH	Reagent	Volume added	Reagent Lot Number	Initials	Time

Notes, Discrepancies, & Resolutions:_____

Data Qualifiers
Ambient Monitoring - AMB18
ENVVEST June 2015

DATA QUALIFIERS:

c	Exceeds DQO but meets contingency criteria of either:
1	SRM certified <10x MDL
2	Insufficient spiking level relative to native sample concentrations
U	Analyte not detected at or above the MDL, MDL reported
J	Analyte detected above the MDL, but less than the RL
--	Not analyzed
NA	Not applicable/available
N	Spiked sample recovery outside QC criterion of 70-130%
NC	Not Certified
&	Accuracy result outside QC criterion of ≤20% PD
*	Precision result outside QC criterion of <30%
NS	Sample not spiked for this analyte
B	Analyte detected in the method blank > RL
	and sample concentration < 10 times detected blank value
b	Data are blank corrected using the batch specific procedural blank
[1]	Reported from the nucleopore filtration method instead of GF/C filters
[2]	Seawater DOC CRM (LOT#03-12) and low carbon water (LCW) were purchased from University of Miami http://yyy.rsmas.miami.edu/groups/biogeochem/CRM.html
[3]	Sample bottle cracked, no data reported
[4]	The laboratory DI water was found to be elevated in OC. The samples were not impacted by the DI water issue. See the QC narrative for more discussion.
HTCO	High Temperature Catalytic Oxidation

QA/QC NARRATIVE

PROJECT: Sinclair and Dyes Inlet Ambient Monitoring, June 2015 (AMB18)

PARAMETER: Total and Dissolved Metals – Al, Cd, Cr, Cu, Ni, Pb, Zn, Hg
Total Suspended Solids (TSS), Salinity (OSAL), Dissolved Organic Carbon (DOC), and Total Organic Carbon (TOC)

LABORATORY: Battelle Marine Sciences Laboratory (MSL), Sequim, Washington

MATRIX: Seawater and Freshwater

SAMPLE CUSTODY AND PROCESSING: Samples were collected from Sinclair and Dyes Inlet region by MSL and the U.S. Navy on 06/16/2015 and 06/17/2015. Samples were hand delivered to MSL by the field team. All samples were received in good condition. Samples were assigned a Battelle Central File (CF) identification number (3106) and were entered into Battelle's sample tracking system. Upon receipt at MSL, the samples designated for total and dissolved metals (TME/DME) were shaken vigorously and approximately 500mL was filtered through a pre-cleaned 0.45µm polyvinylidene fluoride (PVDF) filter membrane inside a class 100 clean bench and the filtrate was transferred to a trace metal clean Teflon bottle. The dissolved and total fractions were each acidified to a pH of < 2.0 with double distilled nitric acid. The samples for TSS and OSAL were stored at 4.0±2°C in low density polyethylene bottles prior to analysis. The samples for TOC and DOC were collected in pre-cleaned glass and stored at -20°C until analyses.

The following lists information on sample receipt and processing activities:

Sample Receipt Dates:	06/16/15 and 06/17/15 EQP BLKS 06/05/15
Cooler temp. on arrival	All coolers were at 4.0±2°C
Collection dates	See Table
TSS analysis dates	06/18/15 and 06/19/15
OSAL analysis dates	06/18/15 and 06/19/15
CVAF analysis dates (Hg)	06/09/15, 07/21/15, 07/22/15, 07/23/15, 07/28/15, 07/29/15, and 08/10/15
TRM Prep/Freshwater Analysis by ICP-MS (Al, Cd, Cr, Cu, Ni, Pb, Zn)	08/13/15
Fe/Pd Preconcentration Seawater Analysis by ICP-MS (Al, Cd, Cr, Cu, Ni, Pb, Zn)	07/16/15 and 07/17/15
TOC/DOC Analysis Date	06/30/15 through 07/10/15

QA/QC DATA QUALITY OBJECTIVES FOR SEAWATER SAMPLES:

Analyte	Analytical Method for Seawater	MS Range of Recovery	SRM Percent Difference	Replicate Precision	Method Detection Limits	Reporting Limits

Mercury	CVAF	70-130%	≤20%	≤30%	0.10 ng/L	0.32 ng/L

METHODS:

Seawater samples were analyzed for eight metals: aluminum (Al), cadmium (Cd), chromium (Cr), copper (Cu), nickel (Ni), lead (Pb), zinc (Zn), and mercury (Hg). Samples were submitted for analyses by two methods. Both freshwater and seawater samples were analyzed for Hg by Cold Vapor Atomic Fluorescence (CVAF) in accordance with Battelle SOP *MSL-I-013*, *Total Mercury in Aqueous Samples by CVAF*, following EPA Method 1631 revision E. The Hg data are reported in ng/L.

Seawater samples were analyzed for all other metals using a preconcentration via a precipitation step followed by reconstitution in a salt free solution in accordance with Battelle SOP *MSL-I-025, Methods of Sample Preconcentration: Iron and Palladium/APDC Coprecipitation and Borohydride (Fe/Pd) Reductive Precipitation for Trace Metals Analysis in Water.* Preconcentrated seawater samples were analyzed by Inductively Coupled Plasma-Mass Spectrometry (ICP-MS) in accordance with Battelle SOP *MSL-I-022, Determination of Elements in Aqueous and Digestate Samples by ICP/MS.* The base methods for this procedure are EPA Method 1638 and

QA/QC NARRATIVE

METHODS (cont): EPA Method 1640.

Freshwater samples identified as < 5% seawater were analyzed for all metals, except Hg, by ICP-MS following the preparation method for total recoverable metals (TRM) described in EPA Method 1640. The analysis for Hg does not require a different method for freshwater versus saltwater.

The ICP-MS data were reported in units of µg/L. The required preconcentration procedure for seawater samples analyzed by ICP-MS includes the addition of chelating agents to induce precipitation of metals under specific conditions. Subsequently, reagents added to the samples should be of the purest quality to result in zero addition of metals to the seawater samples. Therefore the ICP-MS method includes a matrix match step to correct for trace impurities of metals added during the preconcentration step. In previous AMB data sets, the mean reagent blank for each analytical batch was subtracted from the reported sample concentration after the analyses were completed and data were qualified with a "b". The new ICP-MS analytical method includes a matrix matching procedure that allows the quantification and correction of the trace impurities added to the samples during the Fe/Pd preparation. This approach is comparable to the reagent corrected data previously reported and flagged as "b" data qualifier to the ICP-MS data. No flags are required for this data set.

The TSS samples were analyzed following SM2540Dmod using a gravimetric analysis. The modification occurs in the use of a polycarbonate filter versus a glass fiber filter. A comparison between the glass fiber filters (GF/C) and the polycarbonate was conducted on AMB10 and AMB11. In almost all cases the GF/C filters over estimated the TSS concentration. The SOP has been modified to reflect the changes in the type of filter used for isolation of the TSS. No other changes were made to the standard method protocol. The data are reported in units of mg/L.

The OSAL samples were measured using a YSI-30 S-C-T probe. The data are reported in practical salinity units (PSU). The TOC and DOC samples were analyzed using a High Temperature Catalytic Oxidation (HTCO) method. The instrument is specially equipped with high-salt sample combustion tube kit and halogen scrubber for seawater analysis. Seawater samples were acidified to pH <2 by concentrated hydrochloric acid (trace metal grade, Fisher Chemical) prior to analysis then sparged for 2 minutes to remove inorganic carbon (IC). The non-purgeable organic carbons (NPOC) in samples were further converted to CO_2 by oxidation at 680°C with a platinum catalyst. A non-dispersive infrared detector (NDIR) was used to detect the converted CO_2 for quantification of NPOC. The data are reported as both mg/L and µM.

HOLDING TIMES: All samples were analyzed within the established holding times of 90 days for Hg, six months for all other metals, and 7 days between collection and filtration for TSS.

DETECTION LIMITS: Laboratory method detection limits (MDLs) for seawater are reported from the Annually Verified Seawater MDL Study as determined by seven replicates of Sequim Bay Seawater spiked at an appropriate concentration for each analyte. The freshwater MDL was reported from the Annually Verified Freshwater MDL Study determined using seven replicates of deionized water prepared using the TRM preparation. Reporting limits are determined as 3.18 times the laboratory achieved MDL. The data are evaluated and flagged as follows:

U Analyte not detected at or above the MDL, MDL reported
J Analyte detected above the MDL, but less than the RL
N Spiked sample recovery outside QC criterion of 70-130%
& Accuracy result outside QC criterion of ≤20% PD
* Precision result outside QC criterion of <30%

B Analyte detected in the method blank > RL and sample concentration < 10 times detected blank value
c Exceeds data quality objective but meets one of the following contingency criterion:
1 SRM certified <10x MDL or
2 Insufficient spiking level relative to native sample concentrations

METHOD BLANKS: A minimum of three method blanks were analyzed by each instrument with each analytical batch for metals. The average method blank for each batch was less than the RL for all metals.

The method blank for TSS is a polycarbonate filter (Nucleopore) taken through the analytical process with each batch of samples. The blanks were all less than the MDL.

The method blanks for TOC and DOC were deionized water and all below the RL. In addition, low carbon water (LCW) purchased from University of Miami was analyzed as part of the HTCO calibration curve to demonstrate that the instrumentation was not contributing carbon.

LABORATORY CONTROL SAMPLES: A minimum of one LCS (OPR or blank spike) was prepared and analyzed with each analytical batch of 20 or fewer samples for metals. Percent recoveries for LCS samples were within the QC acceptance criterion of 70% to 130% for all metals. The LCS matrix for the seawater samples was Sequim Bay Seawater prepared as both spiked and unspiked samples (e.g. SB LCS and SB Blank, respectively).

MATRIX SPIKE ACCURACY: A minimum of one set of duplicate matrix spikes (MS/MSD) was prepared and analyzed with each analytical batch of 20 or fewer samples for metals. Percent recoveries for matrix spikes were within the QC limits of 70% to 130% for all metals spiked at an appropriate level relative to the native sample concentration. Sample 3106-1632 contained a high native sample concentration for Al and was not spiked at a sufficient level. The data are not flagged as they meet the contingency criteria for the unsufficient spiking level (see “c” flag). Alternate LCS and MS/MSD samples demonstrated acceptable accuracy and precision for Al in this seawater matrix. No additional actions were required.

REPLICATE PRECISION: Laboratory precision was expressed as the relative percent difference (RPD) between laboratory duplicates. The RPD values for the laboratory duplicates were within the QC acceptance criterion of ±30% for all parameters detected above the RL.

STANDARD REFERENCE MATERIAL ACCURACY: Standard reference materials (SRM) were prepared and analyzed with each analytical batch at a minimum frequency of 1 per 20 or fewer samples. Analytical accuracy was expressed as the percent difference (PD) between the measured and the certified value. The SRM for Hg was 1641d, a freshwater SRM, as no seawater SRM was available. The PDs were within the QC acceptance criterion of ≤ 20%.

Two SRMs were analyzed with the analytical batches for Al, Cd, Cr, Cu, Ni, Pb, and Zn quantified by ICP-MS. The freshwater SRM 1640a demonstrated analytical accuracy for each batch analyzed by ICP-MS and the freshwater sample matrices (e.g. outfall 021). Percent recoveries were within the QC acceptance criterion.

CASS-5 is a seawater SRM analyzed with each ICP-MS batch. There is no seawater SRM for Al. High purity standards and the freshwater SRM were used to evaluate analytical accuracy. The SRM is considered for data set evaluation only if it is not certified greater than 10 times the MDL. The CASS-5 certified values for Cd, Cr, Ni, Pb, and Zn are certified values less than 10 times the MDL. The results are flagged with a “c” and considered for data set evaluation only and not for QC certification. The

PDs were within the QC criterion for all metals except Pb. The alternate SRM, seawater LCS and high purity standards provide acceptable QC confirmation for the metals.

A salinity standard was used to verify the accuracy of the salinity measurements. The accuracy range was 0.0-1.7% PD for all salinity measurements.

There are no SRMs available for TOC or DOC. University of Miami provides a laboratory consensus value for DOC in estuarine water http://yyy.rsmas.miami.edu/groups/biogeochem/CRM.html The average of the reference value range was used to calculate the PD for each replicate. The PDs ranged from 0.1 to 13.6%.

Project:	ENVVEST JUNE 2015 Ambient Monitoring (AMB18)	**Date Received:**	06/19/15
Sample Matrix:	Ocean Water		

Case Narrative

All analyses were performed consistent with the quality assurance program of ALS Environmental. This report contains analytical results for samples designated for Tier IV validation deliverables including summary forms and all of the associated raw data for each of the analyses. When appropriate to the method, method blank results have been reported with each analytical test.

Sample Receipt

Forty-four ocean water samples were received for analysis at ALS Environmental on 06/19/15. The samples were received in good condition and consistent with the accompanying chain of custody form. The samples were stored in a refrigerator at 4ºC upon receipt at the laboratory.

General Chemistry Parameters

No anomalies associated with the analysis of these samples were observed.

Results flagged with an asterisk (*) indicate values outside control criteria.

Results flagged with a pound (#) indicate the control criteria is not applicable.

Percent recoveries and relative percent differences (RPD) are determined by the software using values in the calculation which have not been rounded.
