Summary

This report summarizes the in-progress findings (2009–2017) of surface water chemistry within the Puget Sound Naval Shipyard & Intermediate Maintenance Facility (PSNS & IMF, part of Naval Base Kitsap-Bremerton [NBK]), and surrounding marine waters (Sinclair and Dyes Inlets), collected under Project ENVironmental inVESTment's (ENVVEST's) Ambient Monitoring Program. Project ENVVEST was initiated as a cooperative effort among the NBK, regulatory agencies, and local stakeholders to protect beneficial uses of Sinclair and Dyes Inlets. The overall goal of the Ambient Monitoring Program, under Project ENVVEST, is monitoring and tracking environmental water quality to support characterization of the status and trends of ecological resources, assess the effectiveness of cleanup and pollution control measures, and determine whether discharges from all sources are protective of beneficial uses, including those related to aquatic life and human health, in the receiving waters of the Inlets—all in the context of U.S. Environmental Protection Agency (EPA) National Pollution Discharge and Elimination System (NPDES) regulations, Comprehensive Environmental Response, Compensation, and Liability Act cleanup requirements, and EPA aquatic life criteria. This report is provided by the Pacific Northwest National Laboratory's (PNNL's) Marine Science Laboratory (MSL). MSL has been instrumental in designing the field sampling programs for biota, sediments, stormwater, and marine water for Project ENVVEST, and providing chemical analyses of metals and organics at the required low levels of detection to meet Project goals.

The ENVVEST Ambient Monitoring Program objectives are as follows:

- Extend the baseline for assessing continuous process improvement of the PSNS & IMF operations and other sources of contamination into Sinclair and Dyes Inlets.
- Provide data for validation of proposed mixing zones and model verification; ambient data are needed to inform the development of discharge limits, verify and validate discharge models, and assess total loading of all contaminants into the two inlets.
- Obtain data and information about the toxicity of effluents and receiving waters for NPDES permit requirements for the PSNS & IMF; specific toxicity tests of effluents and ambient waters are needed to inform the permit process.
- Develop procedures needed to meet ambient monitoring requirements for water, sediment, and biota in support of adaptive management actions.

Investigative Activities

Under the Ambient Monitoring Program, the PSNS & IMF and MSL initiated marine water sampling in August 2009, and proceeding collections have captured wet and dry periods (e.g., summer/fall [dry] and winter/spring [wet]) for a total of 24 campaigns over 8 years. Monitored stations, to date, have been grouped into five main zones based on proximity to industrial activities: 1) end-of-pipe NPDES-regulated PSNS & IMF outfalls; 2) nearshore along the industrialized waterfront of the PSNS & IMF and within 30 m of a monitored outfall; 3) along the floating security barrier of the PSNS & IMF; 4) nearshore in Sinclair Inlet along the Bremerton and Port Orchard waterfront, the mouth of the Port Washington Narrows, and reference locations in Dyes Inlet, Port Orchard Passage, and Rich Passage; and 5) central marine waters in Sinclair and Dyes Inlets and the passages to central Puget Sound. The 24 sampling campaigns conducted are identified as AMB01 through AMB24.

Sampling consisted of composite or grab samples for permit-specific trace metals (Hg, Cu, Pb, and Zn), ancillary parameters (total suspended solids, total organic carbon, dissolved organic carbon, salinity, ammonia as nitrogen, nitrate + nitrite as nitrogen, total Kjeldahl nitrogen, total phosphorous, and

oil/grease) and supporting metals (Al, Ag, As, Cd, Cr, and Ni). It should be noted that at the time of this report, NPDES permit guidance is only in effect for Cu; other metals classified as permit-specific in this report are those included in current and historic NPDES draft permits. This report summarizes data for these permit-specific metals as both spatial and temporal trends.

Findings

The following conclusions can be drawn, regarding the PSNS & IMF Nearshore zone, from this in-progress summary:

- Hg in the PSNS & IMF waters remains well below chronic criteria specified in Washington Administrative Code (WAC) 173-201A-240 apart from PSNS Nearshore station PS03. Human health criteria have not been reached during monitoring events under Project ENVVEST.
- Cu has intermittently breached WAC 173-201A-240 chronic criteria in the PS07, PS08, PS09 sampling area; the acute level was breached at only one time (i.e., July 2013).
- Pb consistently remains an order of magnitude below the WAC 173-201A-240 chronic threshold in the PSNS & IMF ambient waters.
- Zn, on average, remains well below WAC 173-201A-240 chronic aquatic life criteria.
- The limitation threshold for Cu, established in NPDES Industrial Permit No. WA00206-2 by which the EPA regulates discharges from NBK-Bremerton, has been exceeded once during ENVVEST seasonal monitoring campaigns. The Zn threshold has not been in effect during this monitoring period and is generally an order of magnitude below the limitation threshold. Hg and Pb discharges are not currently regulated.

Recommendations

The data set described in this report provides a baseline for assessing continuous process improvement of the PSNS & IMF operations and other sources of contamination entering Sinclair and Dyes Inlets. The Ambient Monitoring Program can be continually used to this end, with each event in turn demonstrating protection of beneficial uses to all stakeholders. In light of NPDES regulations toward the reduction of Hg, Cu, Pb, and Zn in industrial shipyards (EPA 2008a,b), and strong statistical differences between PSNS & IMF Nearshore and Barrier samples, continuous monitoring should focus on mixing zone model verification, toward mixing zone inclusion in future permit structures. This effort will tie together the Sediment Quality Verification, Mussel Watch, and Non-Dry-Dock Stormwater Programs that MSL has performed and continues to perform for the PSNS & IMF. The recommended primary focus is Cu reduction and fate, based on proximity of its current concentrations in the PSNS & IMF to aquatic life criteria thresholds and its low median effective concentrations relative to a multitude of aquatic species.

1.0 Introduction

The Puget Sound Naval Shipyard & Intermediate Maintenance Facility (PSNS & IMF), a tenant command operating within Naval Base Kitsap (NBK), is located on Sinclair Inlet in Bremerton, Washington. The PSNS is committed to a culture of continuous process improvement for all aspects of operations, including reducing the releases of hazardous materials and waste in discharges. In 2000, the Project ENVVEST (ENVironmental inVESTment) Final Project Agreement was signed as a cooperative program among PSNS & IMF, the U.S. Environmental Protection Agency (EPA), the Washington State Department of Ecology (Ecology), and local stakeholders to leverage and extend efforts to help improve environmental quality and assist in meeting water quality goals for Sinclair and Dyes Inlets and their surrounding watersheds (EPA 2000).

Sinclair and Dyes Inlets in Puget Sound receive pollution from a variety of sources including shipyard operations, marina and vessel traffic, storm event runoff, discharges from wastewater treatment plants, industrial outfalls, and surface streams, as well as legacy sources such as contaminated sediments, that are being addressed by cleanup and restoration activities (URS 2008; Paulson and Keys 2009; Paulson et al. 2010; US Navy 2012). PSNS is the largest industrial facility on Sinclair Inlet and has been in operation since 1896; it functions to repair, refuel, and decommission naval ships (Crecelius et al. 2003). Currently, discharges from the PSNS are regulated by the EPA under the National Pollution Discharge and Elimination System (NPDES) Industrial Permit (Permit No.: WA-000206-2, issued April 1, 1994 and administratively extended since 1999) that covers all of NBK-Bremerton and authorizes the discharge of dry-dock drainage, non-contact cooling water, treated steam-plant wastewater, stormwater runoff, demineralized water, steam condensate, saltwater from the supply system, and potable water from the facility.

In May 2008, the EPA issued a Working Draft NPDES Permit (EPA 2008a) for the PSNS & IMFs' consideration, review, and preparation. In response, additional improvements to best management practices (BMPs) were made to meet All Known, Available, and Reasonable Methods of Treatment (AKART) for preventing, controlling, or abating the pollutants discharged from the PSNS (NAVFAC NW and PSNS & IMF 2012). Implementation of AKART has been shown to be insufficient to meet lowered benchmarks (Jabloner et al. 2009; Brandenberger et al. 2018), necessitating the need for development of a mixing zone (WAC 2006). The work described herein, specifically assists the development of the mixing zone for the Sinclair Inlet areas adjacent to PSNS effluent pipes and continuously monitors the Sinclair and Dyes Inlets surface water system to allow for response to process improvement needs by providing temporal and spatial data on runoff and loading to the watershed from all sources.

To further improve NPDES compliance, EPA Region 10 and PSNS & IMF signed a Federal Facility Compliance Agreement (FFCA, EPA Docket No. CWA-10-2013-0045) on March 23, 2013. The agreement requires the PSNS to implement measures to help achieve compliance. The compliance measures implemented under the FFCA included completing Military Construction projects needed to upgrade the dry-dock process water control system and increase the capacity of the oil waste treatment systems. ENVVEST provides defensible data and guidance for management of these upgrades.

Summarily, data from the Ambient Monitoring Program support modeling of contaminant loading into the inlets (Johnston and Wang 2004; Johnston et al. 2009b; Wang et al. 2009), assessment of the long-term impact of stormwater discharge on sediment and water quality of the inlets (Katz et al. 2004; Katz and Blake 2004; Paulson et al. 2012; Huffman et al. 2012; Paulson et al. 2013), and demonstration of the protection of beneficial uses required under the Clean Water Act (Johnston et al. 2017).

This report is provided by the Pacific Northwest National Laboratory's (PNNL's) Marine Sciences Laboratory (MSL). MSL has been instrumental in designing the field sampling programs for biota, sediments, stormwater, and marine water for Project ENVVEST, and has provided chemical analyses of metals and organics at the required low levels of detection to meet Project goals. Provided, is an in-progress summary of the Ambient Monitoring Program data collected under the supporting Sampling and Analysis Plan for Ambient Monitoring and Toxicity Testing for Sinclair and Dyes Inlets, Puget Sound, Washington: Water Year 2018 Update (referred to as the Quality Assurance Plan [QAP]) (Johnston et al. 2017). The QAP dictates ambient monitoring and toxicity testing sampling and analysis for monitoring the major effluent sources, as well as the receiving waters of Sinclair and Dyes Inlets. This report summarizes the water quality measurements for permit-specific trace metals (Hg, Cu, Pb, and Zn), ancillary parameters (total suspended solids [TSS], total organic carbon [TOC], dissolved organic carbon [DOC], salinity, ammonia as nitrogen [AN], nitrate + nitrite as nitrogen [NNN], total Kjeldahl nitrogen [TKN], total phosphorous [TP], and oil/grease [HEM]), and supporting metals (Al, Ag, As, Cd, Cr, and Ni), which provide source identification support.

2.0 Objectives

The ENVVEST Ambient Monitoring Program objectives are as follows:

1. Extend the baseline for assessing continuous process improvement of the PSNS operations and other sources of contamination into Sinclair and Dyes Inlets.
2. Provide data for validation of proposed mixing zones and model verification; ambient data are needed to inform the development of discharge limits, verify and validate discharge models, and assess total loading of all contaminants into the inlets.
3. Obtain data and information about the toxicity of effluents and receiving waters for NPDES permit requirements for the PSNS. Specific toxicity tests of effluents and ambient waters are needed to inform the permit process.
4. Develop the procedures needed to meet ambient monitoring requirements for water, sediment, and biota in support of adaptive management actions.

The data obtained from this sampling effort are used to assess the impact of all sources of pollution on environmental quality of the two inlets, support further development of the integrated watershed and receiving water models developed for the Sinclair and Dyes Inlet watershed (Wang et al. 2005; Skahill and LaHatte 2006, 2007; Johnston et al. 2009b; Wang et al. 2009), and provide the basis for calculating total maximum daily loads for key environmental contaminants within the watershed (Brandenberger et al. 2008; Lawrence et al. 2012). A key aspect of this work is to quantify trace metal concentrations in saltwater at levels well below marine water quality standards. Data from the network of ambient monitoring stations are evaluated to assess the impact of contaminants discharged into Sinclair and Dyes Inlets, characterize the status and trend of ecological resources, and determine whether discharges from all sources are protective of beneficial uses including aquatic life. The data also provide a basis for determining the need for improvement, assessing the effectiveness of corrective actions, and informing adaptive management actions needed to improve environmental quality and protect aquatic resources.

3.0 Sampling Design

This section addresses the technical approach taken, stations at which samples were taken, and quality objectives and criteria for the measurement data.

3.1 Technical Approach

Marine water sampling was initiated by Project ENVVEST in August 2009, and proceeding collections have captured wet and dry periods (i.e., summer/fall [dry] and winter/spring [wet]) (Noble et al. 2013) for a total of 24 campaigns over 8 years (Figure 1). Stations are grouped into five main types based on local activities: 1) NPDES-regulated PSNS outfalls; 2) nearshore along the industrialized waterfront of PSNS and within 30 m of a monitored outfall; 3) along the floating security barrier of PSNS; 4) nearshore in Sinclair Inlet along the Bremerton and Port Orchard waterfront, the mouth of the Port Washington Narrows, and reference locations in Dyes Inlet, Port Orchard Passage, and Rich Passage; and 5) central marine waters in Sinclair and Dyes Inlets and the passages to central Puget Sound (Table 1). This design allows for spatial analysis moving away from the shorelines to determine the dilution gradient within the water body, and temporal analysis (which captures BMP effectiveness and allows for early indication of new source inputs).

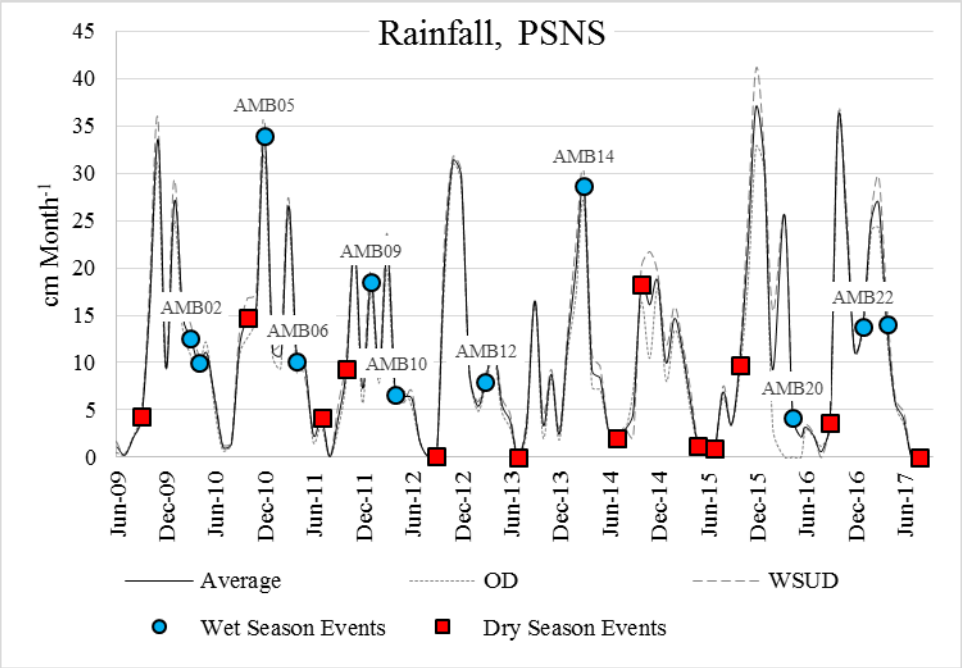

Figure 1. Monthly rainfall in PSNS, with sampling events overlaid. Average rainfall is calculated from Kitsap Public Utility District (KPUD) stations Olympus Drive (OD) and West Sound Utility District (WSUD). These tipping buckets are located 4 miles north and south of PSNS, respectively. Wet season is operationally defined as the months of November through April, and dry season as May through October.

Table 1. Marine water monitoring stations listed by zone designations 2–5.

Surface marine water grabs and 24-hour composites of outfall effluents are analyzed with a focus on current and draft NPDES contaminants of concern Hg, Cu, Pb, and Zn. Ancillary parameters monitored include TSS, TOC, DOC, salinity, AN, NNN, TKN, TP, and HEM. Supporting metals (Al, Ag, As, Cd, Cr, and Ni) are analyzed during selected events and are included in the appended data.

3.2 Sampling Stations

Sinclair and Dyes Inlets are located along the west side of central Puget Sound, and include the cities of Bremerton, Silverdale, and Port Orchard, along their shorelines. These inlets are connected by the Port Washington Narrows and joined to the main basin by Port Orchard and Rich Passages. The watershed drains 252.3 km^2, of which 80% is routed through streams, and 20% drains directly into marine waters (Figure 2) (May and Culinan 2005). Major streams draining to Sinclair Inlet include Blackjack and Gorst Creeks. The maximum depth of both inlets is ~42 m. (See station maps in Sections 3.2.1 and 3.2.2.)

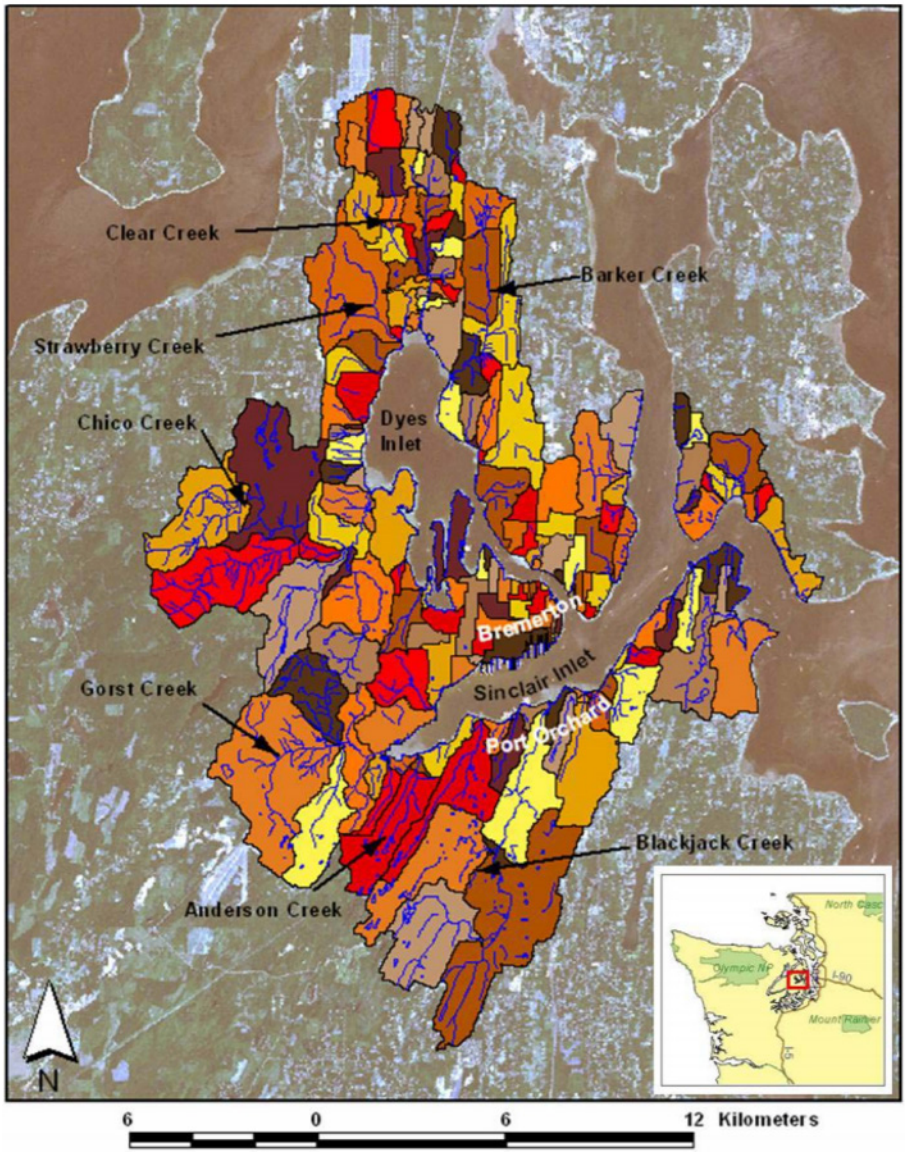

Figure 2. Sinclair-Dyes Inlet Watershed (Reprinted from May and Cullinan 2005); sub-watersheds are delineated as historical Project ENVVEST land-use and land-cover stream, sub-stream, and monitoring point boundaries.

3.2.1 PSNS Outfalls

The four major industrial outfalls (OFs; OF018, OF019, OF021, and OF096 [Figure 3]) at PSNS are included in the seasonal sampling plan. OF018 is partitioned into OF018A and OF018B, both of which discharge the effluents collected from PSNS Dry Docks (DDs) 01 through 05 (total area drained is 57,292 m^2); this is a redundant system (one outfall is operational at a time). The character of the discharge does not change with alternation of the pump-wells; therefore, the data refer to OF018 for either discharge location. Both outfalls discharge just west of DD04 at PSNS Nearshore sampling station PS09. Discharges cycle ~1 hr on:3hr off, and are triggered by the well level. At the discharge points, OF018A discharges below mean lower low water (MLLW) at a height of 5.79 m above the bottom while OF018B discharges above MLLW at 6.52 m. OF096, located east of Pier 5, is also used for direct discharge from DDs 01–05, and empties at PSNS Nearshore sampling station PS10.1. OF019 discharges water from

DD06 at the end of Pier 9, at PSNS Nearshore sampling station PS06. OF019 discharges cycle ~7.5 min on:50 min off. Outfall 19 discharges below MLLW at a discharge height of 7.28 m above the bottom. Water from the DD OFs is composed of hydrostatic relief water (seepage from groundwater and inlet water), vessel cooling water, water from industrial operations, and stormwater during rainy conditions (the total area drained is 19,263 m^2).

OF021 discharges treated water from a steam plant at PSNS, north of Mooring E. The effluent consists of deionized water from regeneration of the plant's ion exchangers along with steam condensate and boiler blow-down water. The treated water is discharged through a 0.1 m pipe with a 12.1 m long diffuser starting 279.8 m from the shore at a depth of 10.67 m (near PSNS Barrier station PS13).

Figure 3. PSNS outfall, pump-well, and dry-dock locations. (Google [n.d.]. [Google Maps Puget Sound]. Retrieved November 1, 2017, from https://google/maps.)

3.2.2 Ambient Waters

As shown in Figure 4, nearshore stations within PSNS, those located within 30 m of a monitored outfall, include identifiers PS01–PS12 (west to east). Moving outward from the waterfront are four stations located near the PSNS security barrier (PS13–PS16). Nearshore stations within Sinclair Inlet, outside of the PSNS security barrier, are identified as SN##; Blackjack Estuary (station ID: BJEST) and Waterman Point (WP) are also sampled within Sinclair Inlet. Other stations included as non-PSNS nearshore (Category 4) include nearshore areas of adjoining passages (Port Orchard and Rich Passages) and Dyes Inlet (Table 1). To complete the gradient, stations centrally located in the inlets and passages are sampled, and identified as M#.

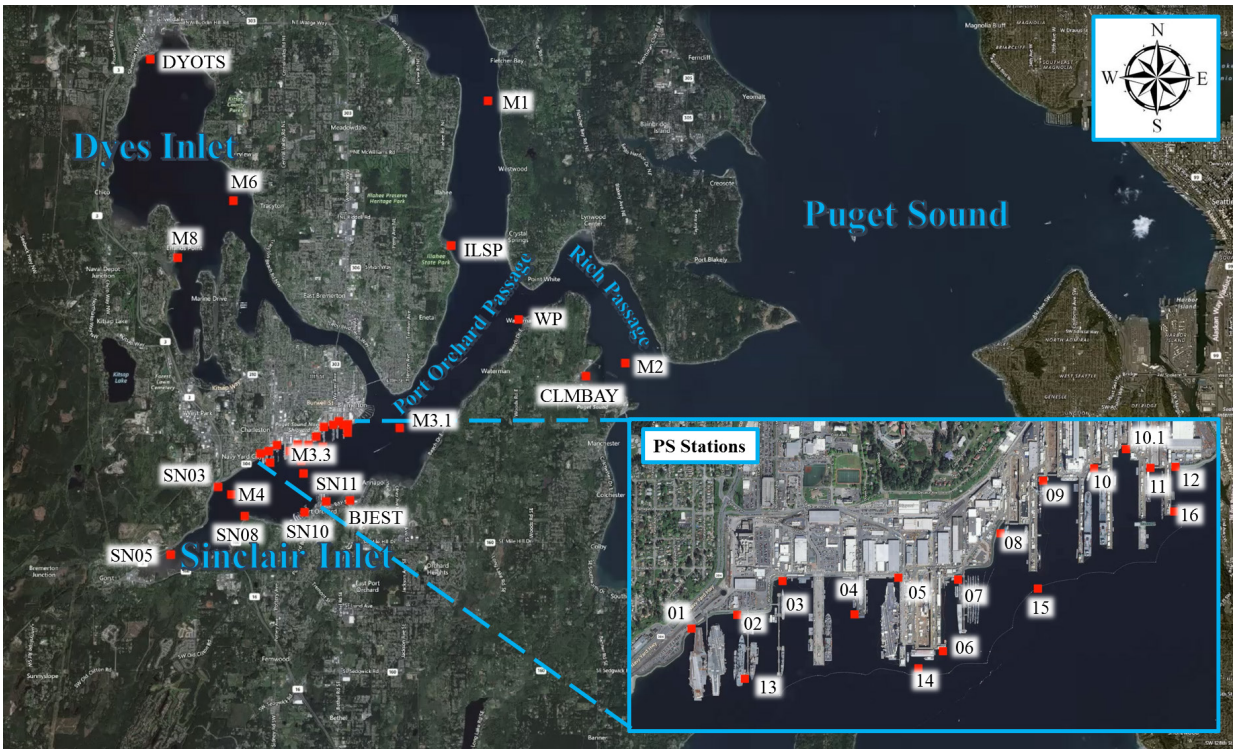

Figure 4. Marine grab sampling stations included in the spatial summary analysis. (Google [n.d.]. [Google Maps Puget Sound]. Retrieved November 1, 2017, from https://google/maps.)

3.3 Quality Objectives and Criteria for Measurement Data

3.3.1 Regulatory

The current PSNS NPDES permit was issued in September 1986, then reissued in April 1994 (#WA-003716-8 or WA00206-2), and covers DD discharges, steam-plant discharges, and stormwater from non-DD areas. This 1994 permit[1] is the current authoritative stormwater discharge guidance for the PSNS, and limits Cu (at all outfalls in this report) and Zn (OF021specific, and no longer in effect) effluent to daily maximums of 33 µg L^{-1} and 1,000 µg L^{-1} respectively; future limits covering Hg, Cu, Pb, and Zn are being drafted (EPA 2008a,b). Under this permit, Zn monitoring ceased prior to ENVVEST monitoring based on process modification. These limits are designated to maintain receiving water concentrations below the marine chronic toxic substance criteria defined in Table 2, which also provides human health criteria for seafood consumption.

[1] Current (1994) NPDES permit for the Shipyard
http://yosemite.epa.gov/R10/water.nsf/95537302e2c56cea8825688200708c9a/e0594922e7a282bc882568010055812a/$FILE/WA0002062_FP.pdf

Table 2. Toxics Substances Criteria[a]

Metal	Aquatic Life Criteria – Marine Waters (µg L^{-1})		Human Health Criteria for Consumption of Organisms[b,c]
	Acute[b]	Chronic	
Hg	1.8	0.025[d]	0.15
Cu	4.8	3.1[b]	1300
Pb	210	8.1[b]	[e]
Zn	90.0	81.0[b]	2900
Cd	42.0	9.3[b]	[e]
Cr (VI)	1100	50.0[b]	[e]
Ni	74.0	8.2[b]	190

(a) Summary reprint of data from WAC 173-201A-240 and 40 CFR 131.36.
(b) The ambient criteria in the table are for the dissolved fraction.
(c) The human health criteria in the table were calculated using a fish consumption rate of 175 g/day.
(d) These criteria are based on the total recoverable fraction of the metal.
(e) EPA is not promulgating human health criteria for this contaminant. However, permit authorities should address this contaminant in NPDES permit actions using the State's existing narrative criteria for toxics.

3.3.2 Analytical

Defensible data capable of distinguishing an overall improvement in water quality from the heterogeneity driven by seasonal variation in environmental systems are required to ascertain a true measure of process improvement. This program focuses on using specialized collection and analysis methods to ensure that the data are of the highest quality and defensibility. Detailed methods are provided in the QAP (Johnston et al. 2017) and summarized here. As an example of specialized analysis, matrix interferent elimination on total and dissolved measurements of trace metals in waters containing as little as 2 practical salinity units (PSUs) requires removal of Na^+, Cl^-, Mg^{2+}, and Ca^{2+} from the matrix prior to inductively coupled plasma mass spectrometry (ICP-MS) injection (Strivens et al. 2015). Without this interferent removal step, data can have significant biases. Project ENVVEST has consistently used leading-edge methodology for quantification of analytes of concern.

The following sections summarize the field quality control, laboratory quality control, and the overall usability of the data. Measurement quality objectives for the analyses conducted for this study are expressed in terms of accuracy, precision, and sensitivity goals. Accuracy and precision are monitored through the analysis of quality control samples (Appendix A, Table A.1) and are parameterized in Appendix A, Table A.2. Analytical parameters, holding times, and detection limits are provided in event Quality Control Narratives (Appendix C, which contains complete campaign reports as provided to PSNS by PNNL's MSL); holding times are defined in Table A.3. The data were found to have acceptable measures of each of these variables.

Accuracy is defined as the degree of agreement between an observed value and an accepted reference value. Accuracy is achieved through the use of laboratory control samples (LCSs), matrix spikes (MSs), matrix spike duplicates (MSDs), and standard reference materials (SRMs). The trace metals LCSs and MSs/MSDs results are summarized in Table B.1 and Table B.2 in Appendix B; recovery of OC, TSS, and nutrient reference material are summarized in Table B.3 and Table B.4 in Appendix B. The recovery of contaminants of concern, Hg, Cu, Pb, and Zn in SRMs are provided below to demonstrate the overall high quality of the data set. Figure 5 shows the results for National Institute of Standards and Technology

SRM 1641e Mercury in Water, and Figure 6, Figure 7, and Figure 8 illustrate the results from the seawater reference material CASS (coastal Atlantic seawater standard).[1] Ancillary metals are depicted in Appendix B (Figures B.1, B.2, and B.3).

Figures 6, 7, and 8 also illustrate a move to an online-preconcentration method for trace metals during AMB20, which minimized sample preparation and eliminated correction errors when accounting for trace impurities. The reproducibility of the online-preconcentration method described by Strivens et al. (2015), coupled with low blanks and detection limits, demonstrated an effective move to an automated procedure using ethylenediaminetriacetic and iminodiacetate acid chelation exchange resin and multi-analyte determination via ICP-MS for total and dissolved Ni, Cu, Zn, Cd, and Pb in marine water samples. Average CASS recoveries using the online-preconcentration method (n = 9) were 109 ± 7%, 104 ± 5%, 103 ± 7%, 101 ± 3%, and 86 ± 8%, respectively.

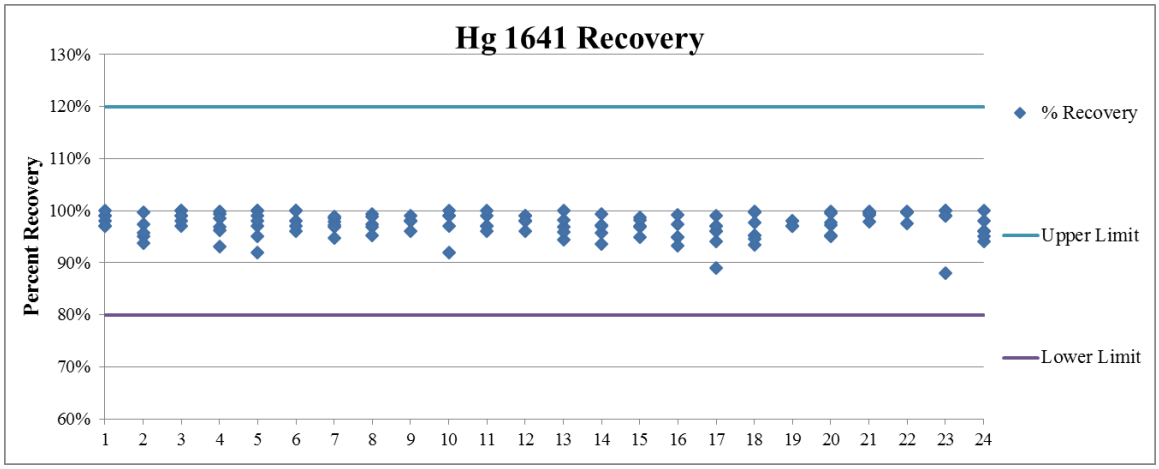

Figure 5. Analytical recovery of National Institute of Standards and Technology SRM 1641e for AMB events 1–24 Hg. Limits are defined by the ENVVEST quality plan as 80–120% recovery from the certified value.

[1] CASS-5 was obtained from the National Research Council of Canada (NRC, Ottawa, ON) and is intended for use during the analysis of nearshore seawater for trace metals; salinity 33.5PSU. This water was collected from Halifax Harbour; at a depth of 12 m. ENVVEST samples had a salinity range of 8.2-31.8 PSU.

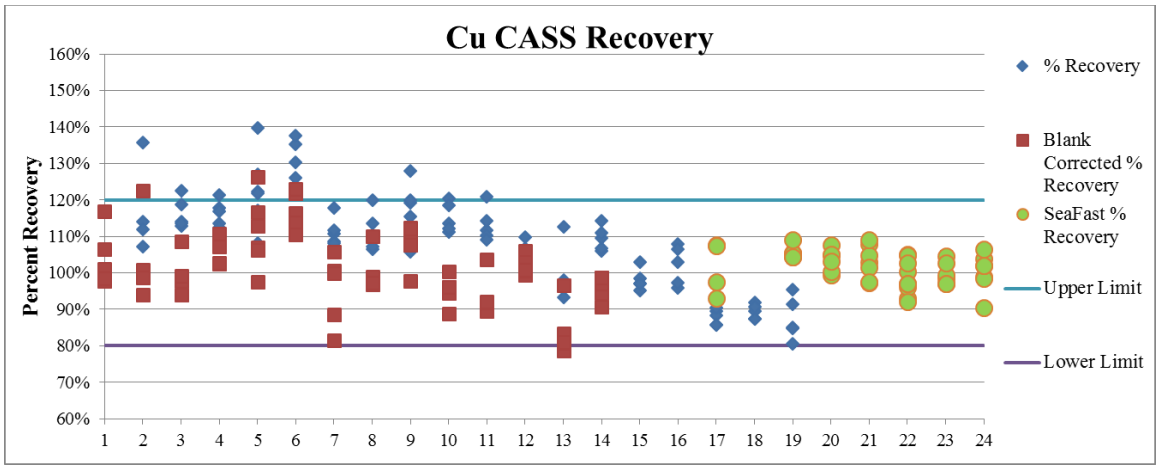

Figure 6. Analytical recovery of CRM CASS for AMB events 1–24 Cu. Events 1–14 were analyzed after Fe-Pd preconcentration, and blank corrected post-analysis; events 15–19 were analyzed after Fe-Pd preconcentration, and blank corrected via inclusion of reagents in the calibration curve; events 20–24 were analyzed via online preconcentration and did not require blank correction. Events 17 and 19 were used for the method comparison manuscript written by Strivens et al. (2015). Limits are defined by the ENVVEST QAP and may be greater or smaller than the certified ranges.

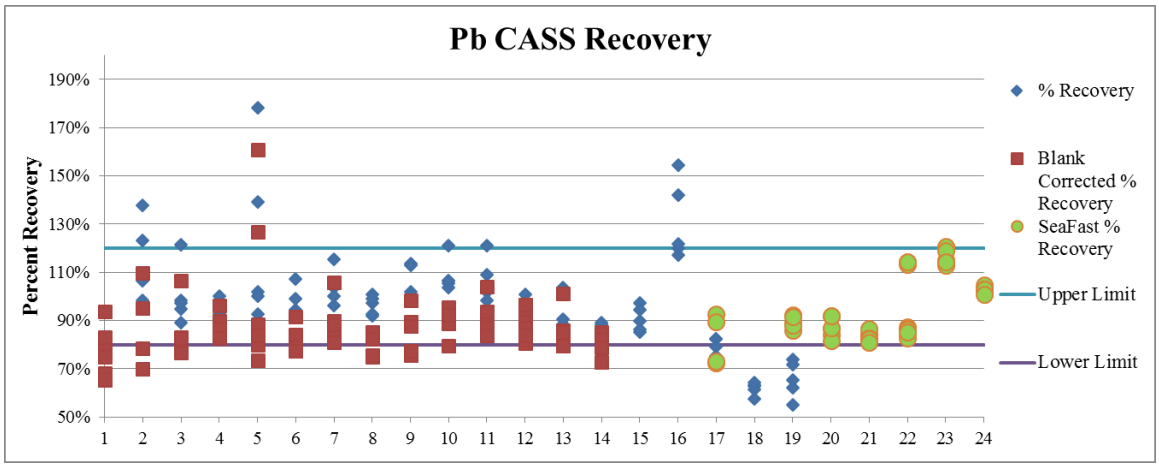

Figure 7. Analytical recovery of CRM CASS for AMB events 1–24 Pb. Events 1–14 were analyzed after Fe-Pd preconcentration, and blank corrected post-analysis; events 15–19 were analyzed after Fe-Pd preconcentration, and blank corrected via inclusion of reagents in the calibration curve; events 20–24 were analyzed via online preconcentration and did not require blank correction. Events 17 and 19 were used for the method comparison manuscript written by Strivens et al. (2015). Limits are defined by the ENVVEST QAP and may be greater or smaller than the certified ranges.

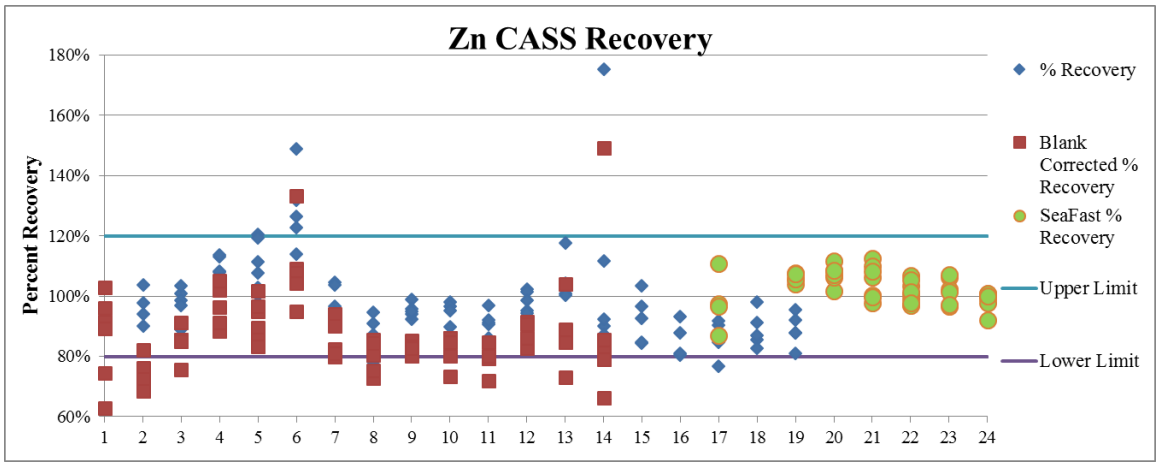

Figure 8. Analytical recovery of CRM CASS for AMB events 1–24 Zn. Events 1–14 were analyzed after Fe-Pd preconcentration, and blank corrected post-analysis; events 15–19 were analyzed after Fe-Pd preconcentration, and blank corrected via inclusion of reagents in the calibration curve; events 20–24 were analyzed via online preconcentration and did not require blank correction. Events 17 and 19 were used for the method comparison manuscript written by Strivens et al. (2015). Limits are defined by the ENVVEST QAP and may be greater or smaller than the certified ranges.

Precision is defined as the degree to which a set of observations or measurements of the same property, obtained under similar conditions, conform to themselves. Precision is achieved through both field and laboratory replication to assess the field variability as well as the laboratory method precision (see Appendix B, Tables B.1 through B.5). The mean relative percent difference (RPD) for laboratory replication met the criteria given in the QAP (Table 12).

Sensitivity is the capability of a test method or instrument to discriminate between measurement responses representing different levels (e.g., concentrations) of a variable of interest. Sensitivity is addressed primarily through the selection of appropriate analytical methods, equipment, and instrumentation. The methods selected for the Sinclair and Dyes Inlet study were chosen to provide the sensitivity required for the end use of the data (Johnston et al 2009a; 2017). This is a quantitative assessment and is monitored through the instrument calibrations and calibration verification samples and the analysis of procedural blanks with every analytical batch (Appendix C).

Method detection limits (MDLs) for trace metals are determined annually according to 40 CFR Part 136 Appendix B for each method of interest by instrument, matrix, and compound of interest. Laboratory MDLs for seawater were reported from an Annually Verified Seawater MDL Study as determined by seven replicates of CASS or Sequim Bay Seawater. The freshwater MDL was reported from the Annually Verified Freshwater MDL Study determined using seven replicates of deionized water prepared using total recoverable metals (TRM) protocol. Reporting limits are determined as 3.18 times the laboratory achieved MDL. Campaign-specific MDLs are listed on data reports in Appendix C.

Data in Appendix C are evaluated and flagged with qualifiers as follows:

Table 3. Analytical Data Qualifiers

Flag	Definition
--	Not analyzed
&	Accuracy result outside QC criterion of ≤20% PD
*	Precision result outside QC criterion of <30%
B	Analyte detected in the method blank > RL and sample concentration < 10 times detected blank value
b	Data are blank corrected using the batch specific procedural blank
J	Analyte detected above the MDL, but less than the RL
N	Spiked sample recovery outside QC criterion of 70-130%
NA	Not applicable/available
NC	Not Certified
NS	Sample not spiked for this analyte
U	Analyte not detected at or above the MDL, MDL reported
c#	Exceeds data quality objective but meets one of the following contingency criterion:
	1 SRM certified <10x MDL or
	2 Insufficient spiking level relative to native sample concentrations
	3 Sample concentration <10x MDL

4.0 Methods

4.1 Sample Collection Methods

A detailed description of the sampling methods is provided in the QAP (Johnston et al. 2009a, 2017). Briefly, sampling followed ultra-clean collection procedures recommended for trace metals at EPA water quality criteria levels in EPA Method 1669 (EPA 1996a). Sampling bottles were double bagged in a Class 100 clean room and shipped to the PSNS. All sample bottles were handled using clean gloved hands following the "dirty hands/clean hands" technique (EPA 1996a). Surface grab (~1 m depth) samples were collected directly into sample bottles by hand from a small boat using a pre-cleaned polyvinyl chloride sampling pole.

Originally, Sigma® automated samplers were used to collect industrial effluents discharged from all outfalls. Events after AMB18, and those selected for 24-hour temporal analysis used, in OF019, a Teledyne-Isco® 6700 series sampler with a custom back-pressure modulation chamber assembled by Cardno TEC (Charlottesville, Virginia) (Figure B.4); this required manual composition of data reported in this publication. Additionally, after AMB22, OF018A&B were equipped with in-line piston style Sentry ISOLOK SAB Automatic Fixed Volume Samplers.

The auto-samplers were programmed to collect water when discharge pumps were activated, such that a 10 L composite sample was collected over 24 hours. The composite effluent water was then subsampled for chemical analysis. Auto-samplers in pump-wells were subject to some collection variation; when an auto-sampler failed to collect a composite, grab sampling was implemented for a single pump-down phase; or a combination of grab samples was collected over multiple pump-downs.

Samples were held at <6°C during transit to MSL, and were delivered immediately after collection by MSL staff. Sample custody records associated with the physical possession and/or storage history of each

individual sample are documented in accordance with MSL-A-001 *Sample Login Procedures* and MSL-A-002 *Sample Chain-of-Custody* (Battelle 2016b, 2013) and are available upon request.

4.2 Laboratory Methods

4.2.1 Trace Metals

Immediately upon receipt, in the laboratory, each trace metals sample was shaken vigorously and approximately 500 mL was filtered through a pre-cleaned 0.45 µm polyvinylidene fluoride filter membrane inside a Class 100 clean bench. The dissolved and total fractions were then acidified to a pH of <2.0 using Optima™ grade nitric acid (Fisher, Pittsburgh, PA, USA).

For all events, samples were analyzed for total and dissolved Hg using Cold Vapor Atomic Fluorescence (CVAF) in accordance with Battelle Standard Operating Procedure (SOP) MSL-I-013, *Total Mercury in Aqueous Samples by CVAF* (Battelle 2011), following EPA Method 1631 revision E (EPA 2002).

Freshwater samples identified as <5% seawater were prepared for metals analysis, other than Hg, following the preparation method for TRM described in EPA Method 1640 (EPA 1997).

Prior to analyses of marine water metals—Ag, Al, As, Cd, Cu, Ni, Pb, and Zn—samples were either preconcentrated in accordance with Battelle SOP MSL-I-025, *Methods of Sample Preconcentration: Iron and Palladium/APDC Coprecipitation and Borohydride Reductive Precipitation for Trace Metals Analysis in Water* (AMB01–AMB19) (Battelle 2003), or using an online preconcentration via the seaFast™ chelation column method for Cd, Cu, Ni, Pb, and Zn (AMB20-24) (Strivens et al. 2015). After AMB19, marine samples were analyzed for Al using ICP-MS direct injection at 15x dilution; as was the case with Cr for all events.

Preconcentrated and diluted marine samples were analyzed by ICP-MS in accordance with Battelle SOP MSL-I-022, *Determination of Elements in Aqueous and Digestate Samples by ICP/MS* (Battelle 2016a); the base methods for this procedure are EPA Method 1638 and EPA Method 1640 (EPA 1996b. 1997). Samples were analyzed for As by flow-injection atomic spectroscopy (FIAS) in accordance with Battelle SOP MSL-I-030, *Determination of Metals in Aqueous and Digestate Samples by Hydride Generation Atomic Absorption (HGAA) with Flow Injection (FIAS)* (Battelle 2009); the base method for this procedure is EPA Method 270.3 (EPA 1986).

4.2.2 Ancillary Parameters

The TSS concentrations were determined by gravimetric analysis in accordance with Battelle SOP MSL-I-041 *Total Suspended Solids Measures* (Battelle 2012); the base method for this procedure is SM2540D (Eaton et al. 2005). A method modification was made beginning with AMB12: the use of polycarbonate filters replaced glass fiber filters to reduce the error of weighing very small amounts of particles on a much higher mass filter.

The salinity was measured using a YSI-30 S-C-T probe. Salinity is reported in ppt (parts per thousand) calculated from the instrument's conductivity and temperature values using algorithms found in Standard Methods for the Examination of Water and Wastewater.

For AMB01–AMB09, OC samples were analyzed by Persulfate-Ultraviolet or Heated-Persulfate Oxidation SM5310 C, by ALS Environmental, Kelso, WA (APHA 1998). Beginning with AMB10 TOC

and DOC samples were analyzed using a High Temperature Catalytic Oxidation (HTCO) method, in accordance with Battelle MSL-W-011 *Determination of Total and Dissolved Organic Carbon in Seawater by high Temperature Catalytic Oxidation* (Battelle 2014). The instrument is specially equipped with a high-salt sample combustion tube kit and halogen scrubber for seawater analysis. Briefly, seawater samples are acidified to pH <2 by concentrated hydrochloric acid (trace metal grade, Fisher Chemical) prior to analysis, then sparged for 2 minutes to remove inorganic carbon (IC). The non-purgeable organic carbons (NPOCs) in samples are then converted to CO_2 by HTCO with a platinum catalyst. A nondispersive infrared detector then is used to detect the converted CO_2 for quantification of NPOC.

Analyses of AN, NNN, TKN, TP, and HEM were also conducted by ALS Environmental, following EPA Methods 350.1, 353.2, 351.4, 365.3, and 1664 (O'Dell 1993; 1993b; Schlueter 1977; EPA 1978, 1999), respectively.

4.3 Visual Presentation of Data Trends

Graphical representation of data uses the following log transformations for resolution of both data gradients and respective regulatory limits: (1) Hg and Pb are expressed as bases of 10; (2) Cu as base 2; and (3) Zn as base 5.

5.0 Results

Surface water results are subdivided into spatial (Section 5.1.1) and temporal (Section 5.1.2) analyses and outfall results are given in Section 5.2. A summary of all the data is provided in Appendix B. To provide the overall descriptive statistics for this interim report, the spatial data were reviewed and the following were removed from the data set for statistical analyses: 1) sites omitted from more than three events; 2) all samples labeled as duplicates or deep stations because the analysis was for surface water trends; and 3) multiple samples taken during the same AMB event and sampling location that were averaged as one sample (e.g., B, C, or D samples). The overall range of spatial data are displayed in box and whiskers plots where lower and upper hinges correspond to the first and third quartiles. Whiskers extend from the upper and lower hinges to the largest value no farther than 1.5x the inner quartile range. Data plotted beyond the whiskers are considered to be outliers. Temporal data are displayed as mean values and maxima of the total set.

5.1 Surface Water

Nearshore stations within PSNS, identified as PS01–PS12 are plotted from west to east, as are PSNS Barrier stations PS13–PS16 and nearshore stations within Sinclair Inlet. Dyes Inlet nearshore stations are given west to east, and adjoining passage nearshore stations are plotted south to north. To complete the gradient, stations centrally located in the inlets and passages are plotted in an "inner-to outer" fashion in relation to the PSNS (Sinclair, Dyes, passages).

5.1.1 Spatial Comparison

Spatial data set impact zones variance of metals regulated under WAC 173-201A-240 were compared using one-way analysis of variance (ANOVA) followed by post hoc Tukey when applicable. Statistical significance is indicated as yes or no in tables accompanying each spatial narrative; no meaning $p > 0.05$.

5.1.1.1 Mercury

The trends in Figure 9 and Figure 10 show Hg variation between the PSNS industrial areas and the receiving waters. For Hg_{diss}, there are statistically significant differences among impact zones [$F_{(3,800)} = 10.3$, $p = <0.0001$]. There is, however, no significant difference between the PSNS Barrier (average = 0.000296 ± 8.55E-05 µg L^{-1}) and the nearshore/marine stations of the inlets (averages = 0.000355 ± 0.000214 µg L^{-1} and 0.000295 ± 0.000181 µg L^{-1}, respectively) (Table 4); meaning greater levels within PSNS (average = 0.000635 ± 0.00126 µg L^{-1}) are not significant from the barrier downstream. Station PS03, the elevated point within the PSNS, is affected by the tidal flush through Hg containing backfill. For Hg_{tot}, there are statistically significant differences within the sum of impact zones, where $\alpha = 0.05$, [$F_{(3,800)} = 12.5$, $p = <0.0001$]. The significance mirrors the dissolved fraction when comparing PSNS Nearshore to Sinclair/Dyes Nearshore stations, with averages of 0.00162 ± 0.00268 and 0.00102 ± 0.000858 µg L^{-1}, respectively, but when comparing the Sinclair/Dyes Nearshore to Sinclair/Dyes marine stations (average = 0.000747 ± 0.000444 µg L^{-1}) there is a lack of gradient; however, non-PSNS point sources (e.g., Sinclair Inlet nearshore Station SN05, the greatest average Hg points outside of the PSNS, is impacted by the Bremerton Wastewater Treatment Plant outfall) do occur within the sampling area. In relation to toxic substances criteria, the marine chronic value was exceeded only at PS03 (AMB01 [08/31/2009] and AMB17 [04/07/2015]). The impact zone mean Hg levels fall within the expected ranges for Puget Sound waters with respect to total levels; dissolved levels are, on average, four times greater in the PSNS Nearshore impact zone and two times greater in the remaining zones in comparison to the Puget Sound review by Sedar (2009).

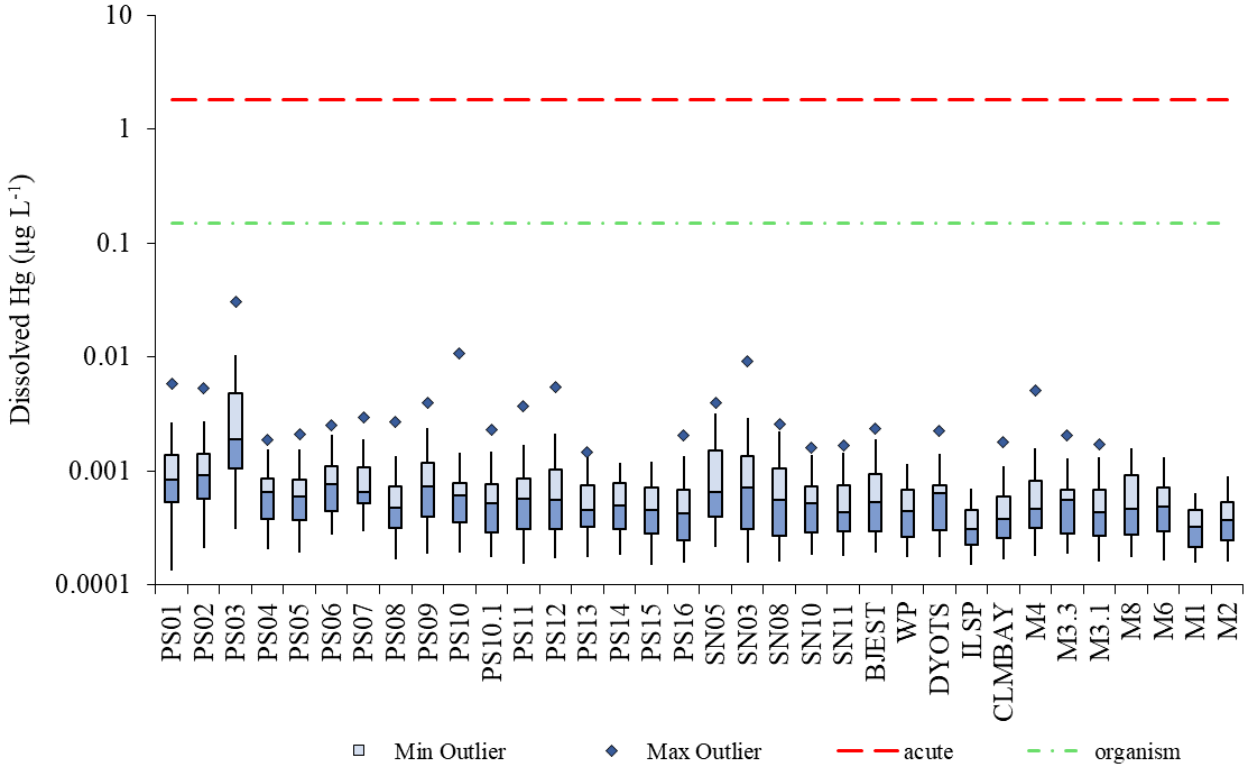

Figure 9. Hg_{diss} as the average of 24 sampling events over 8 years moving from the high to low impact zones of Sinclair and Dyes Inlets. Regulatory limits are those describe in WAC 173-201A-240 and 40 CFR 131.36 and provided in table 2 of the current report.

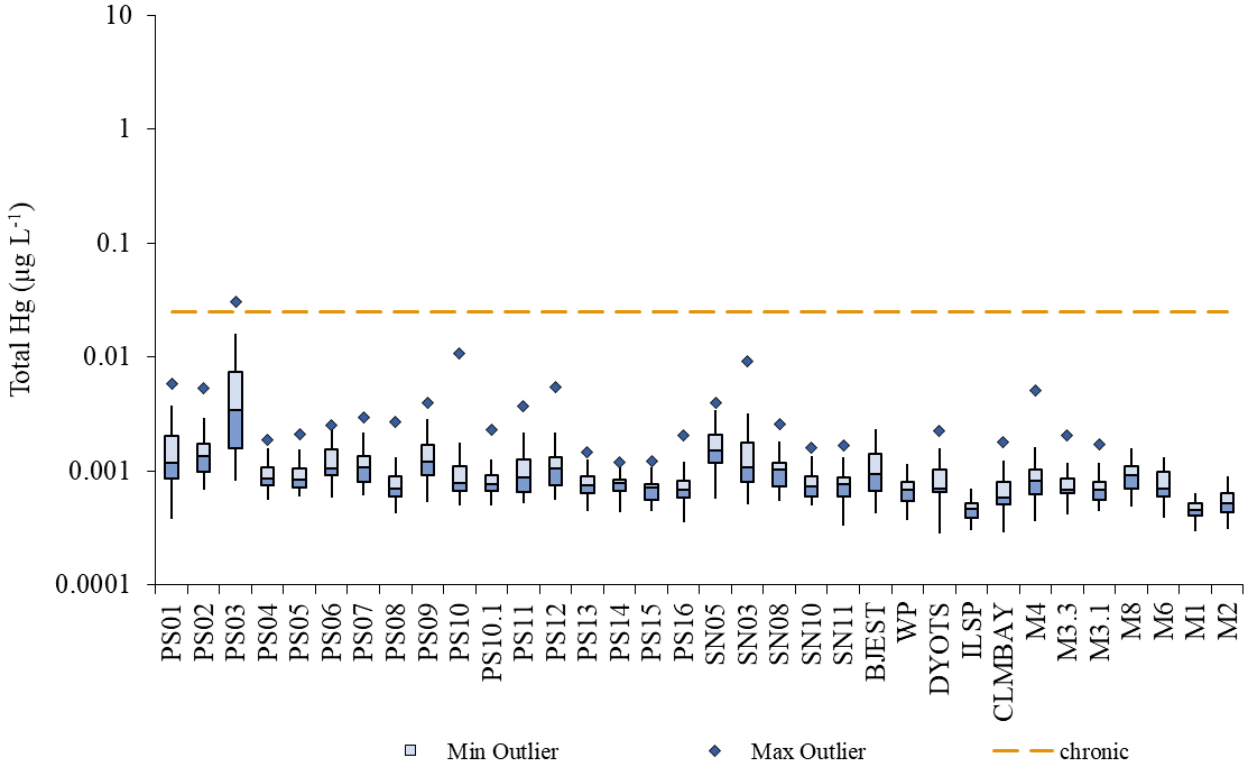

Figure 10. Hg_{tot} as the average of 24 sampling events over 8 years moving from the high to low impact zones of Sinclair and Dyes Inlets. Regulatory limits are those describe in WAC 173-201A-240 and 40 CFR 131.36 and provided in table 2 of the current report.

Table 4. Tukey Honest Significant Difference (HSD) analysis of the differences between impact zones for Hg_{diss}.

Contrast	Difference	Pr > Diff	Significant	Lower bound (95%)	Upper bound (95%)
PSNS Nearshore vs Sinclair/Dyes Marine	0.000341	< 0.0001	Yes	0.000141	0.000541
PSNS Nearshore vs PSNS Barrier	0.000339	0.0019	Yes	0.0000968	0.000582
PSNS Nearshore vs Sinclair/Dyes Nearshore	0.000300	0.0001	Yes	0.000120	0.000480

Sinclair/Dyes Nearshore vs Sinclair/Dyes Marine	0.000271	0.441	No	-0.000196	0.000738
Sinclair/Dyes Nearshore vs PSNS Barrier	0.000258	0.631	No	-0.000298	0.000813
PSNS Barrier vs Sinclair/Dyes Marine	0.0000134	1.00	No	-0.000573	0.000600

5.1.1.2 Copper

The trend in Figure 11 shows Cu variation between the PSNS industrial areas and the proximate waters. For Cu_{diss}, there are statistically significant differences determined as a one-way ANOVA among impact zones [$F_{(3,800)} = 218.0$, $p = <0.0001$]. Post hoc comparisons using the Tukey Honest Significant Difference (HSD) test indicated that the mean differences were significant for all impact zone comparisons sans Sinclair/Dyes Nearshore vs Sinclair/Dyes Marine (Table 6). Elevated stations within the PSNS are those intermediate DD discharges, but are also affected by sewage overflows; those outside of the PSNS, SN10 and SN11, are collected from the Port Orchard Sinclair Marina within the City of Port Orchard and the Port Orchard Marina foot-ferry terminal within the Port of Bremerton, respectively. In general, the data show few exceedances of the Toxic Substances Criteria (i.e., PS07–09); these exceedances occurred during AMB04 (09/08/2010), AMB05 (11/18/2010), AMB9 (12/06/2011), AMB12 (02/12/2013), and AMB13 (06/08/2013). In comparison to five other Puget Sound shipyard areas (Friday Harbor, Skyline, John Wayne, Des Moines, and Swantown Marinas), mean inner shipyards are 1.57 µg L^{-1} and PSNS is 1.53 µg L^{-1}; Puget Sound marine averages 0.323 µg L^{-1} Sinclair/Dyes Marine is 0.535 µg L^{-1} (Hobbs et al. 2018).

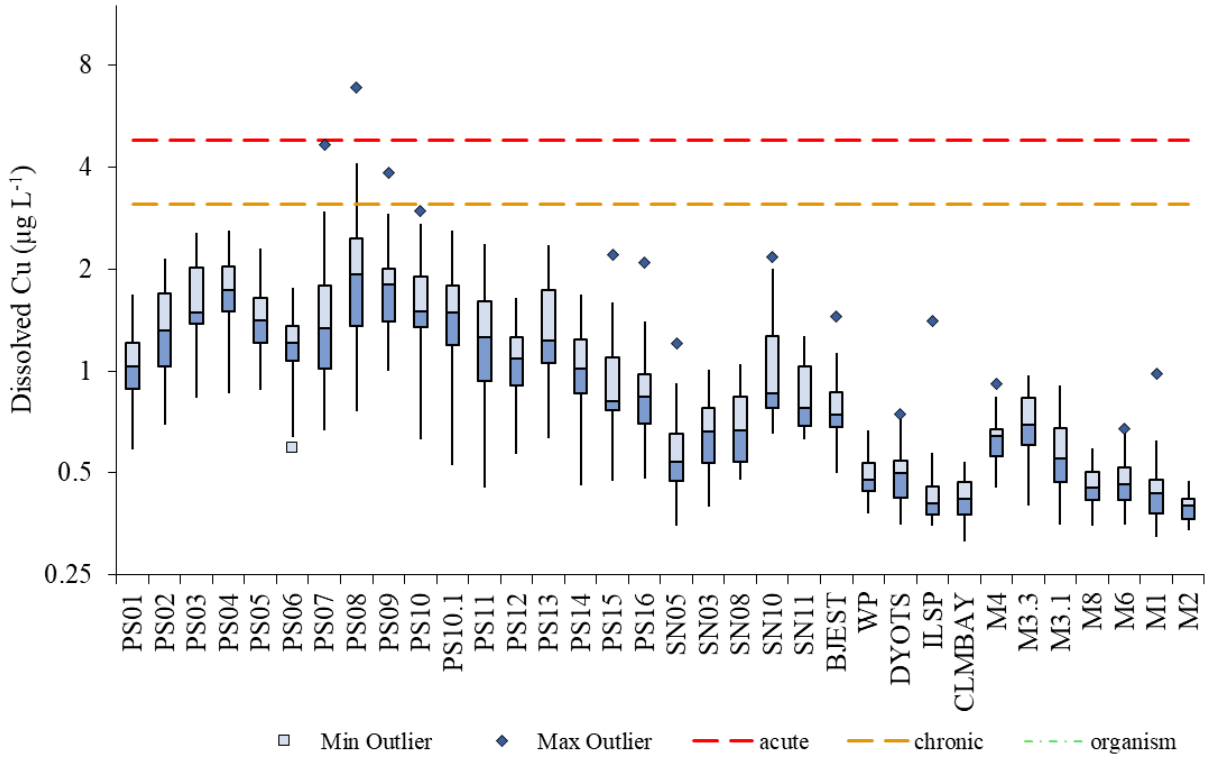

Figure 11. Cu_{diss} as the average of 24 sampling events over 8 years moving from the high to low impact zones of Sinclair and Dyes Inlets. Regulatory limits are those describe in WAC 173-201A-240 and 40 CFR 131.36 and provided in table 2 of the current report; human health criteria for consumption of organisms is greater than the data range.

Table 6. Tukey HSD analysis of the differences between impact zones for Cu_{diss}.

Contrast	Difference	Pr > Diff	Significant	Lower Bound (95%)	Upper Bound (95%)
PSNS Nearshore vs Sinclair/Dyes Marine	0.992	< 0.0001	Yes	0.873	1.11
PSNS Nearshore vs Sinclair/Dyes Nearshore	0.876	< 0.0001	Yes	0.769	0.984
PSNS Nearshore vs PSNS Barrier	0.480	< 0.0001	Yes	0.335	0.625
PSNS Barrier vs Sinclair/Dyes Marine	0.512	< 0.0001	Yes	0.352	0.672
PSNS Barrier vs Sinclair/Dyes Nearshore	0.396	< 0.0001	Yes	0.245	0.548
Sinclair/Dyes Nearshore vs Sinclair/Dyes Marine	0.116	0.090	No	-0.012	0.243

5.1.1.3 Lead

The trend in Figure 12 shows Pb variation between the PSNS industrial areas and the adjoining waters. For Pb_{diss}, there are statistically significant differences among impact zones within the waterbody, but samples have shown all areas to be an order of magnitude lower than the toxic substances criteria. There is no significant difference between the PSNS Barrier and the Sinclair/Dyes Nearshore impact zones (Table 7). In comparison to five other Puget Sound shipyard areas, mean inner shipyards are 0.0653 µg L^{-}

[1] and PSNS is 0.0228 µg L^{-1}; Puget Sound marine averages 0.0819 µg L^{-1} and Sinclair/Dyes Marine is 0.0162 µg L^{-1} (Hobbs et al. 2018).

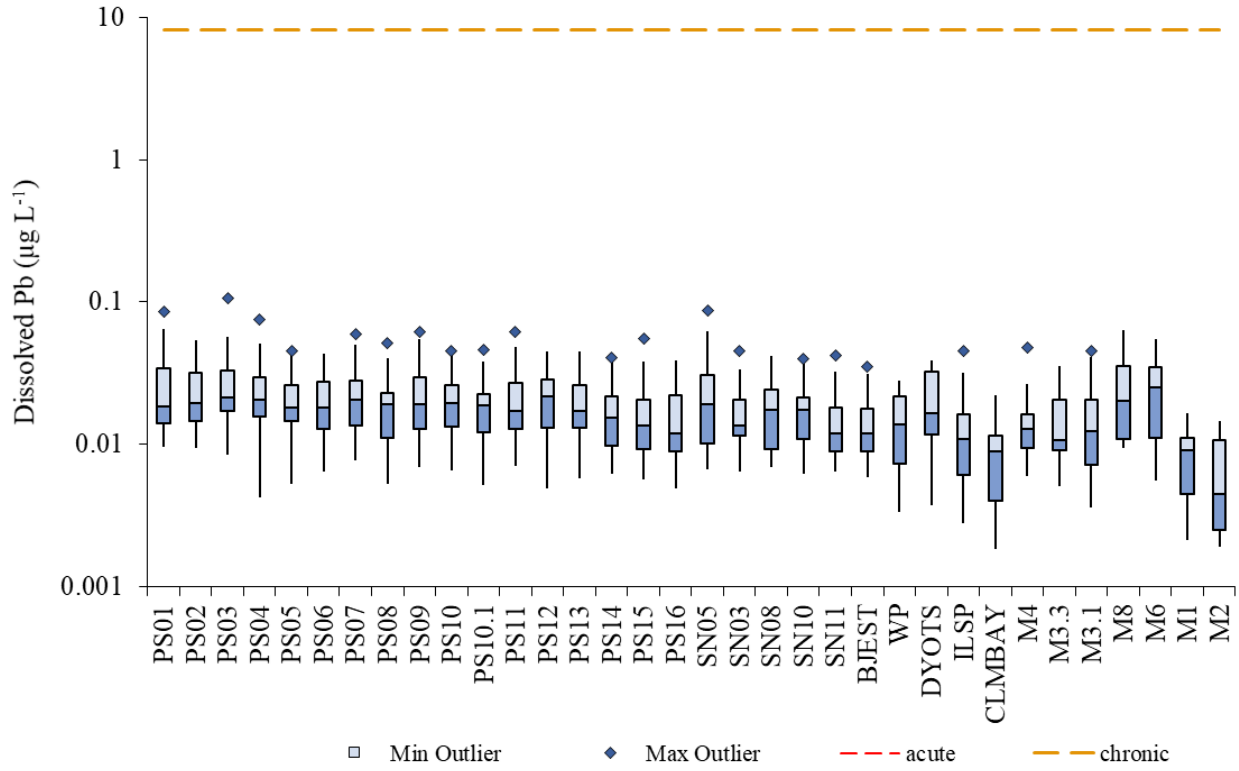

Figure 12. Pb_{diss} as the average of 24 sampling events over 8 years moving from the high to low impact zones of Sinclair and Dyes Inlets. Regulatory limits are those describe in WAC 173-201A-240 and 40 CFR 131.36 and provided in table 2 of the current report; the acute threshold exceeds the given scale.

Table 7. Tukey HSD analysis of the differences between impact zones for Pb_{diss} [$F_{(3,800)}$ = 15.4, p = <0.0001].

Contrast	Difference	Pr > Diff	Significant	Lower Bound (95%)	Upper Bound (95%)
PSNS Nearshore vs Sinclair/Dyes Marine	0.00666	< 0.0001	Yes	0.00351	0.00980
PSNS Nearshore vs Sinclair/Dyes Nearshore	0.00614	< 0.0001	Yes	0.00331	0.00898
PSNS Nearshore vs PSNS Barrier	0.00549	0.0013	Yes	0.00167	0.00931
PSNS Barrier vs Sinclair/Dyes Marine	0.00117	0.892	No	-0.00305	0.00538
PSNS Barrier vs Sinclair/Dyes Nearshore	0.000653	0.975	No	-0.00334	0.00465

5.1.1.4 Zinc

The trend in Figure 13 shows Zn variation between the PSNS industrial areas and the receiving impact zones. For Zn_{diss}, there is a statistically significant difference among the four zones [$F_{(3,800)}$ = 86.6, p =

<0.0001]; and the averages display a gradient from PSNS Nearshore (averages = 5.52 ± 4.24 µg L^{-1}) to the PSNS Barrier (averages = 3.09 ± 2.17 µg L^{-1}) to the Sinclair/Dyes Nearshore (averages = 1.87 ± 3.10 µg L^{-1}) and the Sinclair/Dyes Marine (averages = 1.19 ± 0.900 µg L^{-1}); post hoc Tukey analysis shows the variation between Sinclair/Dyes Nearshore and Sinclair/Dyes Marine is not significant (Table 8). Elevated Stations within the PSNS display the same trend as Cu, and are those nearest to DD effluent pipes; those outside of the PSNS, SN10 and SN11, are collected from the Port Orchard Sinclair Marina within the City of Port Orchard and the Port Orchard Marina foot-ferry terminal within the Port of Bremerton, respectively. No data exceed the marine chronic criterion of 81.0 µg L^{-1}; the highest value within the PSNS was 54.8 µg L^{-1} (PS07 [East side of DD06], AMB01, 09/01/2009); the highest value outside of the PSNS was 39.1 µg L^{-1} (ILSP [Illahee State Park], AMB01, 09/01/2009). In comparison to five other Puget Sound shipyard areas, mean inner shipyards are 3.91 µg L^{-1} and PSNS is 5.52 µg L^{-1}; Puget Sound marine averages 0.812 µg L^{-1} and Sinclair/Dyes is 1.19 µg L^{-1} (Hobbs et al. 2018).

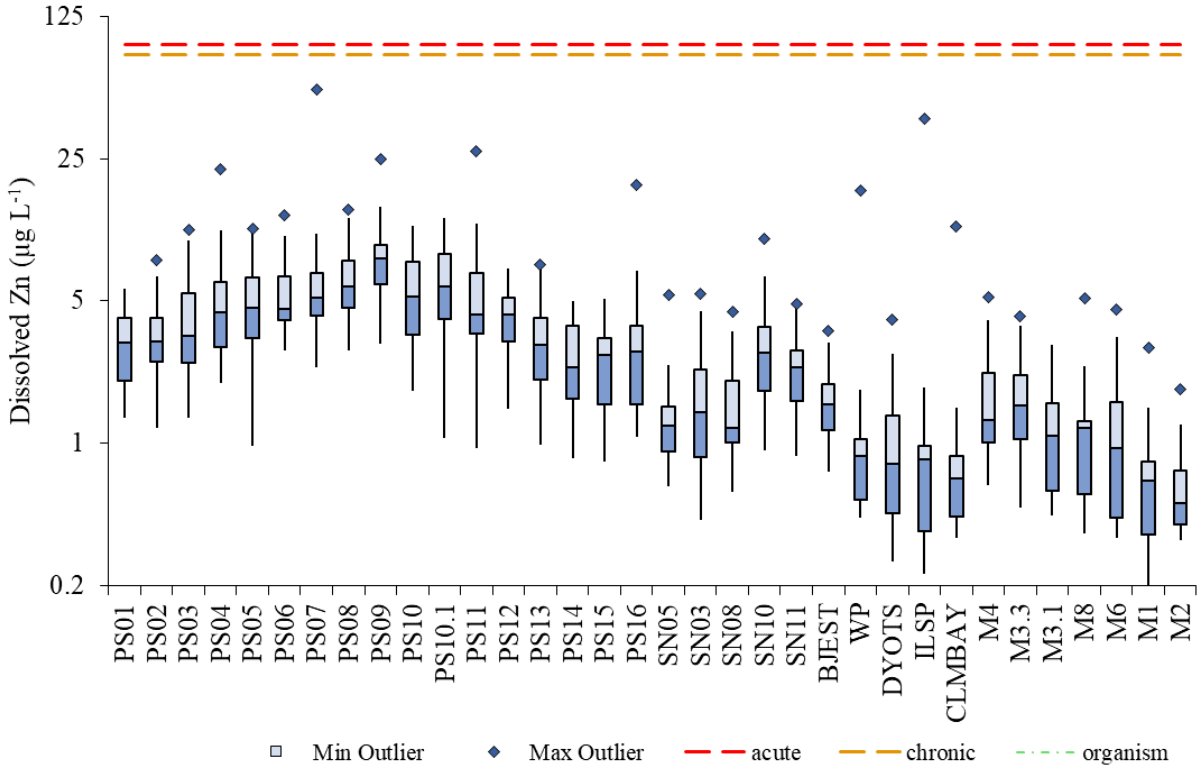

Figure 13. Zn_{diss} as the average of 24 sampling events over 8 years moving from the high to low impact zones of Sinclair and Dyes Inlets. Regulatory limits are those describe in WAC 173-201A-240 and 40 CFR 131.36 and provided in table 2 of the current report; human health criteria for consumption of organisms is greater than the data range.

Table 8. Tukey HSD analysis of the differences between impact zones for Zn_{diss}.

Contrast	Difference	Pr > Diff	Significant	Lower Bound (95%)	Upper Bound (95%)
PSNS Nearshore vs Sinclair/Dyes Marine	4.33	< 0.0001	Yes	3.52	5.13
PSNS Nearshore vs Sinclair/Dyes Nearshore	3.64	< 0.0001	Yes	2.91	4.36
PSNS Nearshore vs PSNS Barrier	2.43	< 0.0001	Yes	1.45	3.41

Contrast	Difference	Pr > Diff	Significant	Lower Bound (95%)	Upper Bound (95%)
PSNS Barrier vs Sinclair/Dyes Marine	1.90	< 0.0001	Yes	0.816	2.98

Sinclair/Dyes Nearshore vs Sinclair/Dyes Marine	0.690	0.165	No	-0.170	1.55

5.1.1.5 Ancillary Parameters

Table 9 provides physicochemical parameter summary statistics for each of the four marine water impact zones. The purpose of these data is to aid in interpreting the chemical concentrations and are considered vital model input variables (complete data are given in Appendix C). There were no significant differences among impact zones for any ancillary parameter except TSS, where Sinclair/Dyes Nearshore stations had significantly higher levels than the PSNS Nearshore stations (mean difference of 2.47 mg L^{-1}: $p = 0.008$) likely due to the fact that many of these stations are in riparian flumes. Other parameters given here track primary productivity potential. Additional ancillary parameters, dissolved oxygen and turbidity, are recorded in PSNS monthly fecal coliform monitoring reports.

In brief,

- Salinity is a key component of marine habitat monitoring, because it transforms trace metal chemistry interactions with biota via stratification and circulation patterns.
- Knowledge of OC levels is integral to modeling bioavailability of metals due to protective effects provided by metal-OC complexes.
- Dissolved metals can attach to suspended particles, and thus an increase in TSS can often indicate potential pollution. Increased TSS is also indicative of the development of harmful algal blooms.
- All species of nitrogen are biochemically interconvertible components of the biological nitrogen cycle. The presence of ammonia nitrogen in surface water can be indicative of sewage pollution.
- Phytoplankton productivity in the marine waters can be limited by the availability of fixed inorganic nitrogen, nitrate being the principal form. Total inorganic nitrogen = NNN + AN.
- TKN has also been measured for select events when quantification of organic nitrogen was requested by PSNS (e.g., total organic nitrogen = TKN − AN)
- P, supplied naturally by continental weathering, is also monitored as a primary productivity-limiting nutrient due to the potential for introduction of excess levels by fertilizer runoff and sewage system leaks.
- HEM is monitored, primarily in outfall composites, due to a total petroleum hydrocarbon limit (15 mg L^{-1}) under the effectual NPDES regulations.

Table 9. Statistics of Ancillary Parameters by Impact Zone.

	Parameter	Salinity (PSU)	TOC (mg L^{-1})	DOC (mg L^{-1})	TSS (mg L^{-1})	AN (mg L^{-1})	NNN (mg L^{-1})	TKN (mg L^{-1})	TP (mg L^{-1})	HEM (mg L^{-1})

TOC refers to total organic carbon; DOC refers to dissolved organic carbon; TSS refers to total suspended solids; AN refers to ammonia as nitrogen; NNN refers to nitrate+nitrite as nitrogen; TKN refers to total Kjeldahl nitrogen; TP refers to total phosphorous; HEM refers to oil and grease (hexane extractable material).

5.1.2 Temporal Comparison

Temporal analysis of receiving waters is provided as a means to illustrate the water quality trends of metals of concern in the four impact zones (PSNS Nearshore, PSNS Barrier, Sinclair/Dyes Nearshore, and Sinclair/Dyes Marine).

5.1.2.1 Linear Time

Mercury

Dissolved Hg surface water samples designated as PSNS Nearshore have averaged (0.000810 ± 0.00118 µg L^{-1} Hg_{diss}) over time; PSNS Barrier (0.000317 ± 0.0000552 µg L^{-1} Hg_{diss}); Sinclair/Dyes Nearshore (0.000353 ± 0.00151 µg L^{-1} Hg_{diss}); Sinclair/Dyes Marine (0.000317 ± 0.00103 µg L^{-1} Hg_{diss}) (Figure 14). Average Hg_{diss} has remained an order of magnitude below the toxics substances criteria for human health. The highest values within the PSNS, those values >0.00375 µg L^{-1}, are from Station PS03.

Total Hg surface water samples designated as PSNS Nearshore have averaged (0.00187 ± 0.00268 µg L^{-1} Hg_{tot}) over time; PSNS Barrier (0.000735 ± 0.0000155 µg L^{-1} Hg_{tot}); Sinclair/Dyes Nearshore (0.000958 ± 0.00602 µg L^{-1} Hg_{tot}); Sinclair/Dyes Marine (0.000719 ± 0.00264 µg L^{-1} Hg_{tot}) (Figure 15). Average Hg_{tot} has breached the toxics substances criteria for chronic toxicity twice. As with Hg_{diss}, these elevated instances are associated with Station PS03. Hg in general shows neither a positive or negative trend over time for the impact delineated areas.

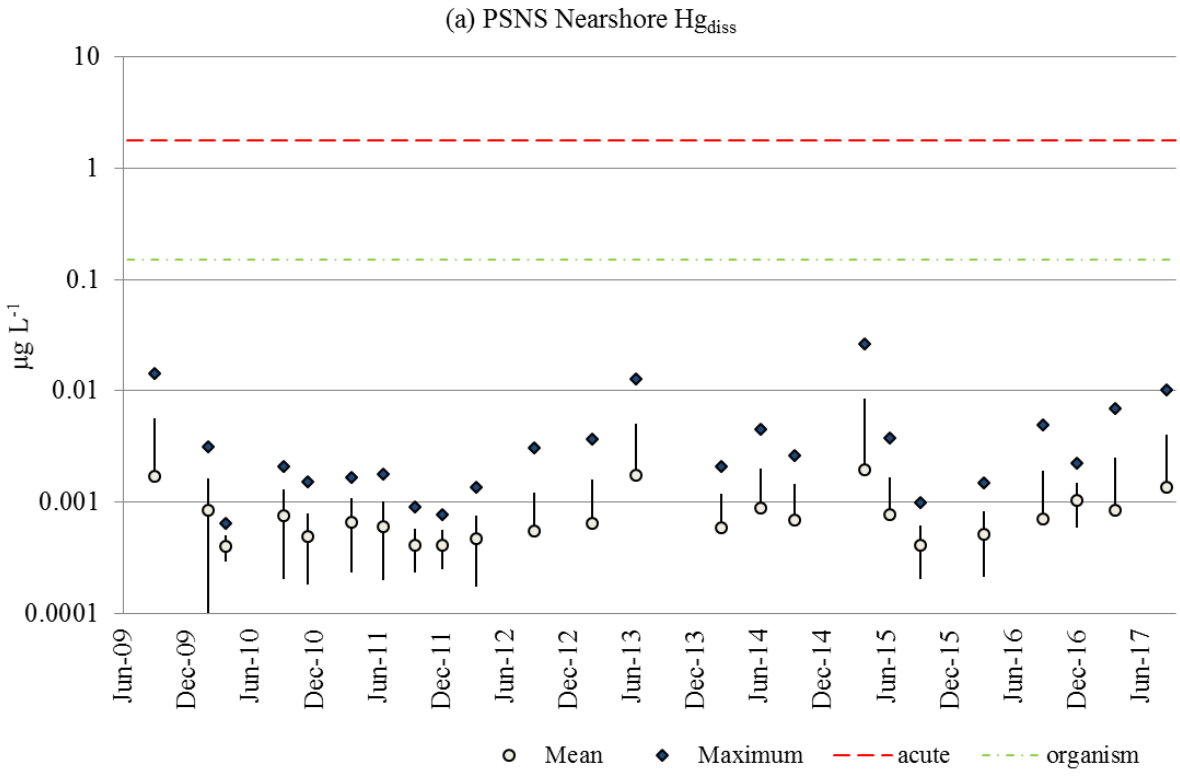

Figure 14a–d. Hg_{diss} trend over 8 years (24 sampling events) with stations divided in four areas: (a) PSNS Nearshore (n = 357), (b) the PSNS Barrier (n = 95), (c) the Sinclair/Dyes Nearshore (n = 250), and (d) the Sinclair/Dyes Marine (n = 179). Open circles are the mean values; diamonds are the maxima.

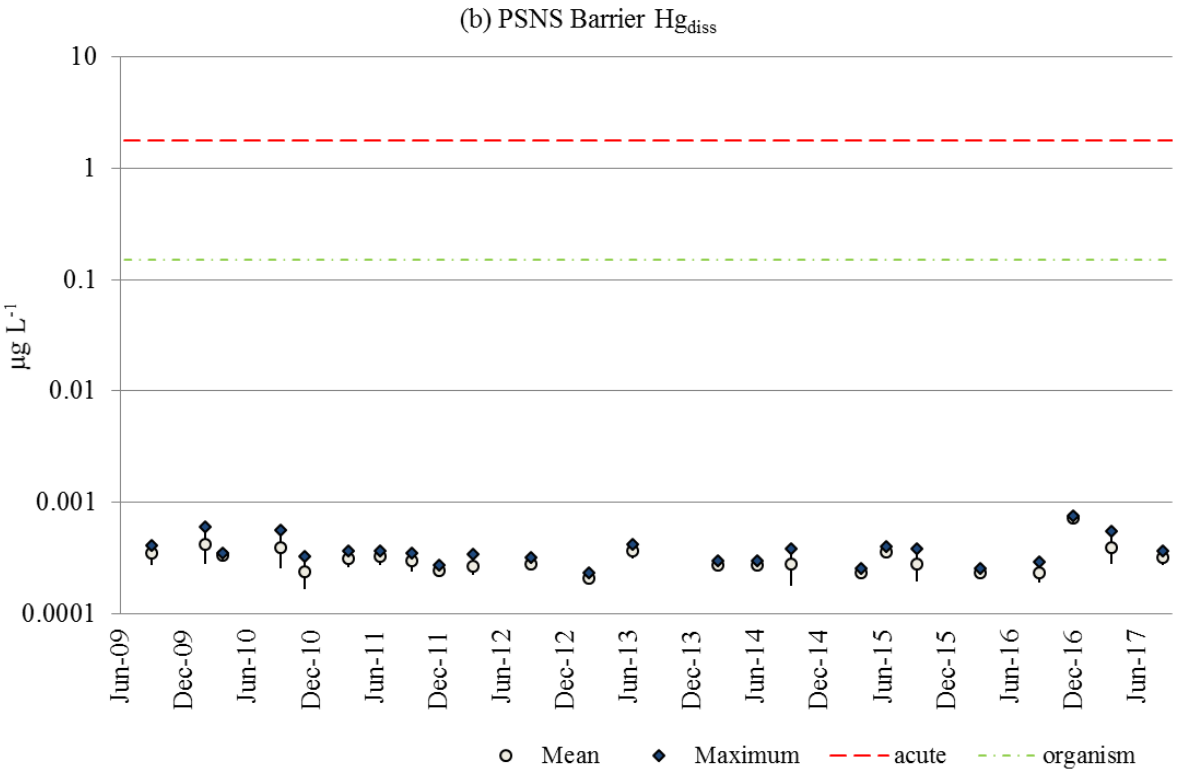

Figure 14. (contd)

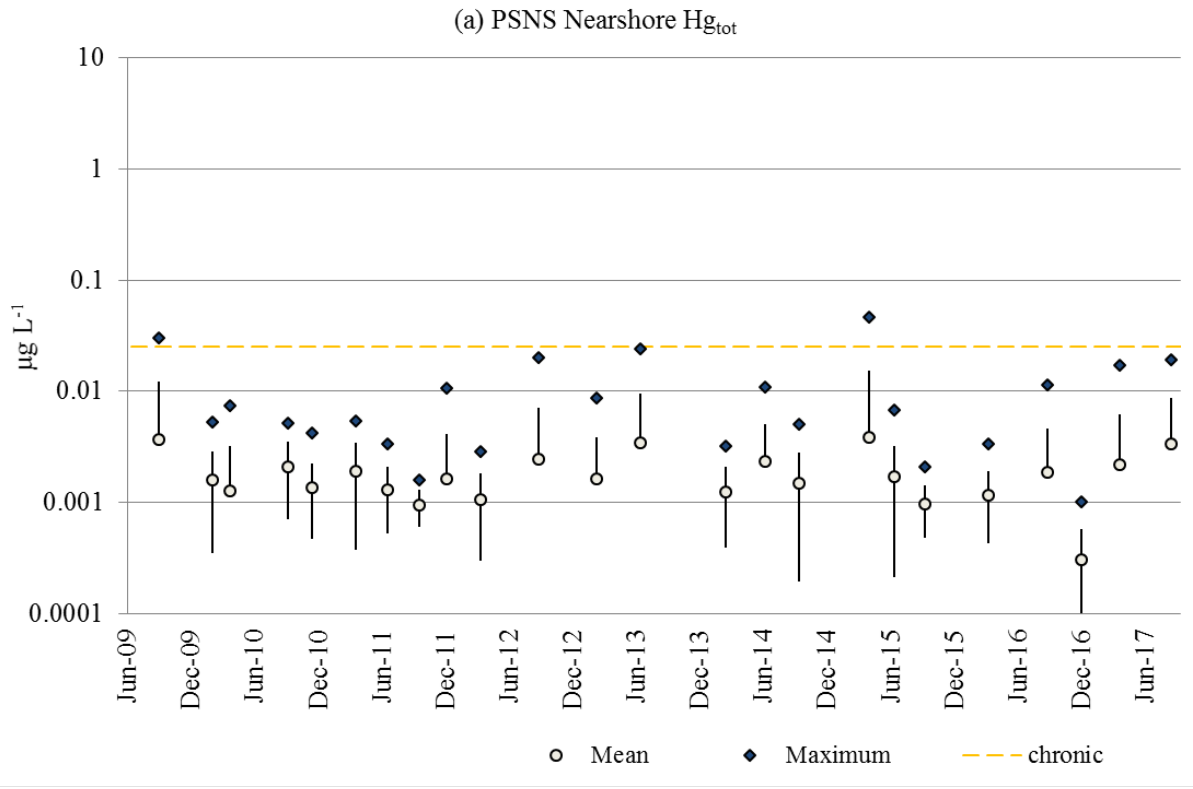

Figure 15. Hg_{tot} trend over 8 years (24 sampling events) with stations divided in four areas: (a) PSNS Nearshore (n = 357), (b) the PSNS Barrier (n = 95), (c) the Sinclair/Dyes Nearshore (n = 250), and (d) the Sinclair/Dyes Marine (n = 179). Open circles are the mean values; diamonds are the maxima.

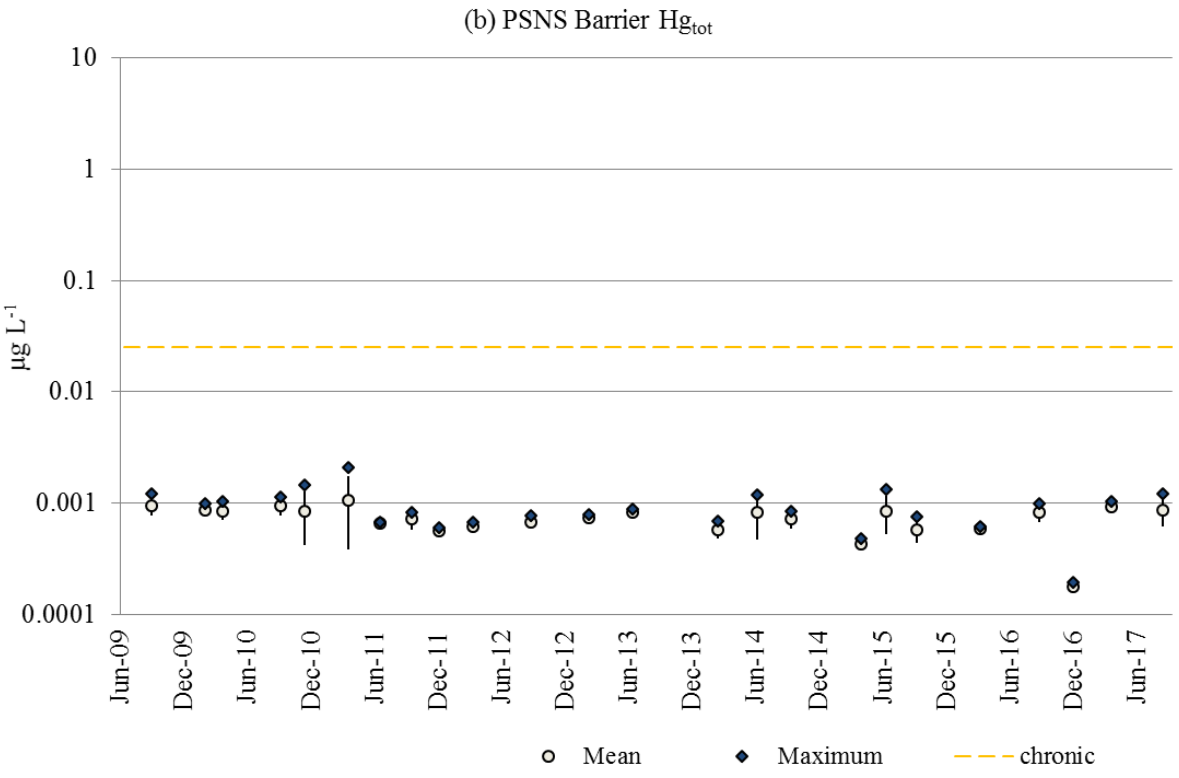

Figure 15. (contd)

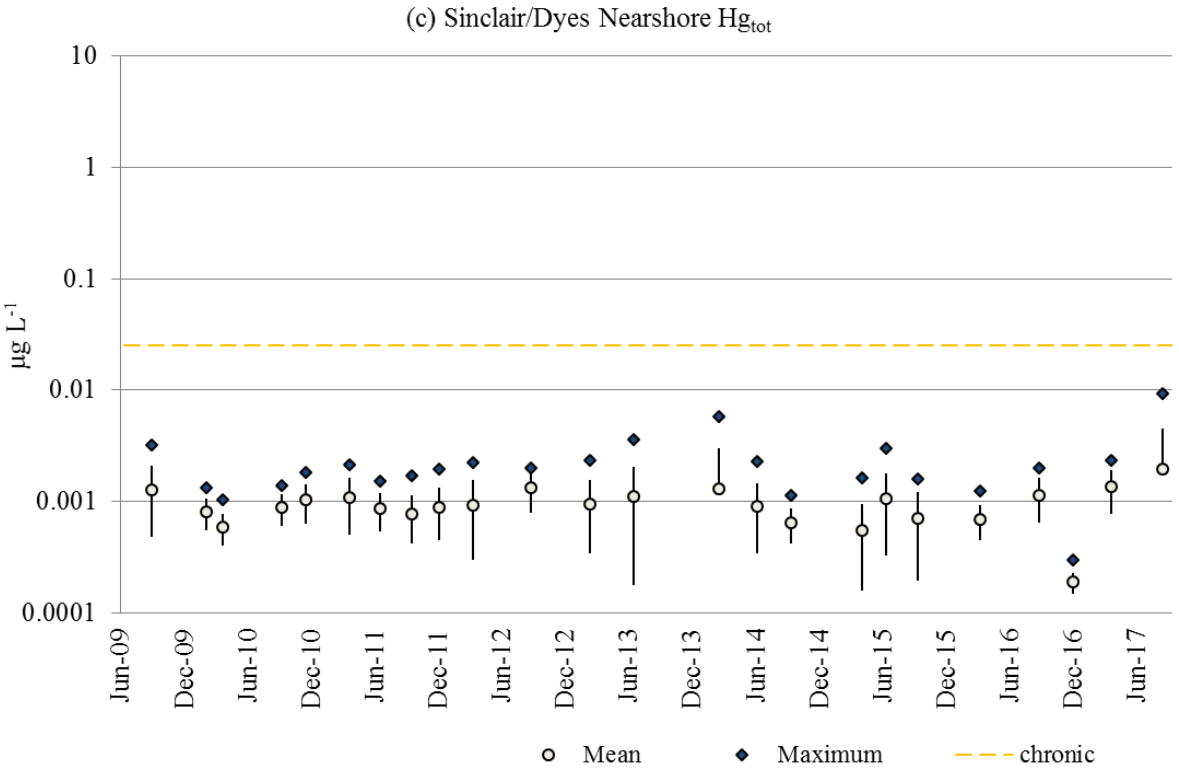

Figure 15. (contd)

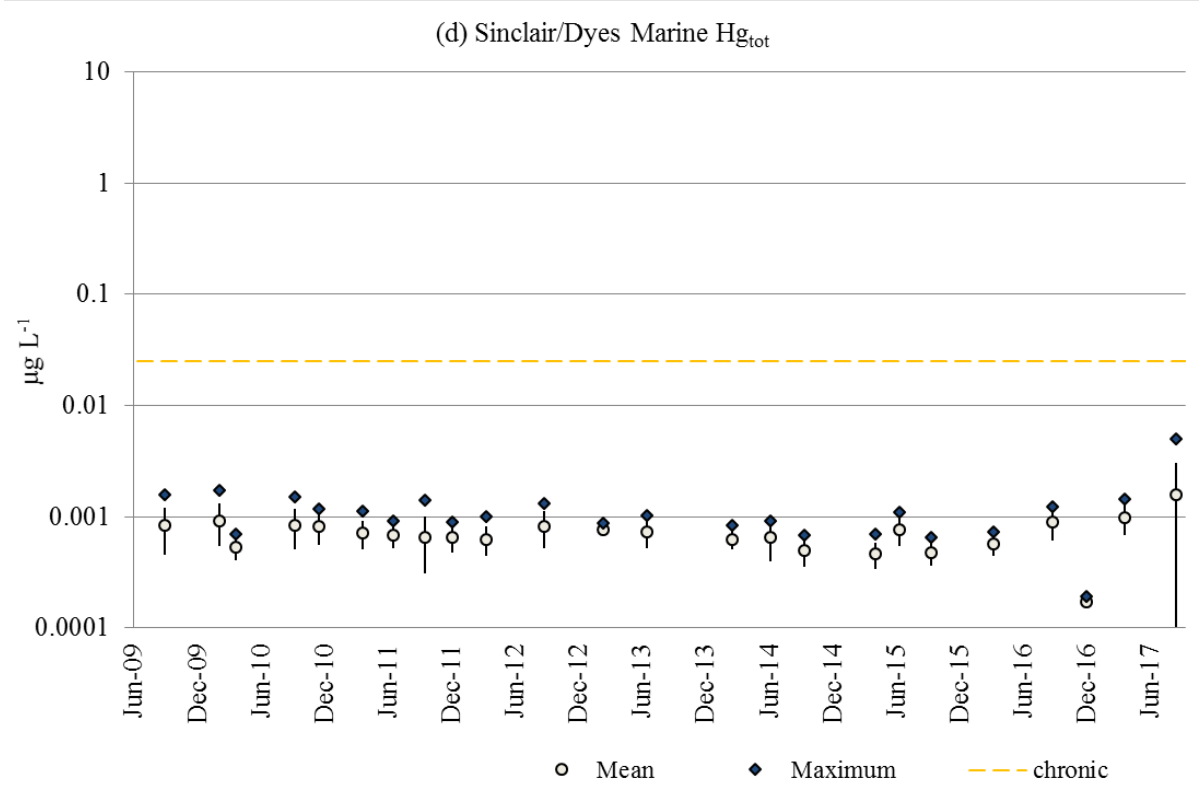

Figure 15. (contd)

Copper

Dissolved Cu surface water samples designated as PSNS Nearshore have averaged (1.53 ± 0.563 µg L^{-1} Cu_{diss}) over time; PSNS Barrier (1.05 ± 0.338 µg L^{-1} Cu_{diss}); Sinclair/Dyes Nearshore (0.642 ± 0.234 µg L^{-1} Cu_{diss}); and Sinclair/Dyes Marine (0.538 ± 0.138 µg L^{-1} Cu_{diss}) (Figure 16). Cu_{diss} has remained below the toxics substances criteria in areas outside of the PSNS. Samples within the PSNS breached marine chronic toxicity at Stations PS07, PS08, and PS09; and marine acute toxicity at Stations PS07 and PS08. In general these values are dropping; the last >acute value was collected on July 18, 2013.

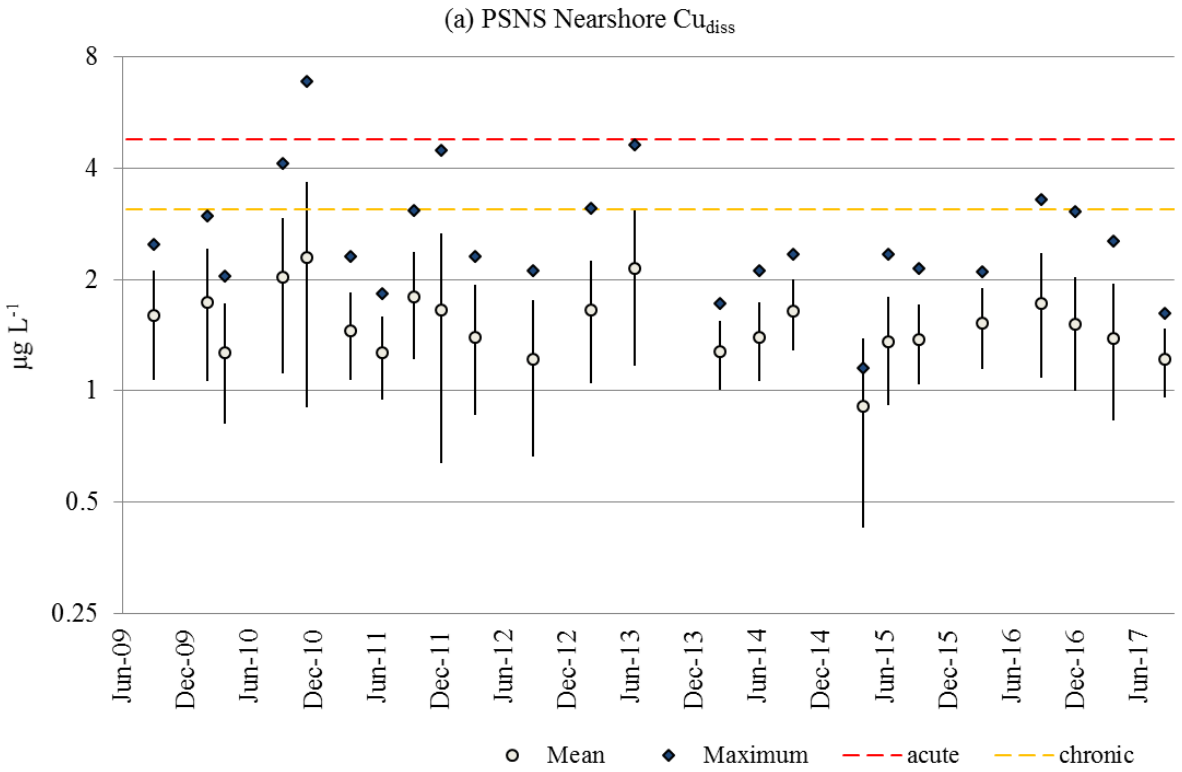

Figure 16. Cu_{diss} trend over 8 years (24 sampling events) with stations divided in four areas: (a) PSNS Nearshore (n = 357), (b) the PSNS Barrier (n = 95), (c) the Sinclair/Dyes Nearshore (n = 250), and (d) the Sinclair/Dyes Marine (n = 179). Open circles are the mean values; diamonds are the maxima.

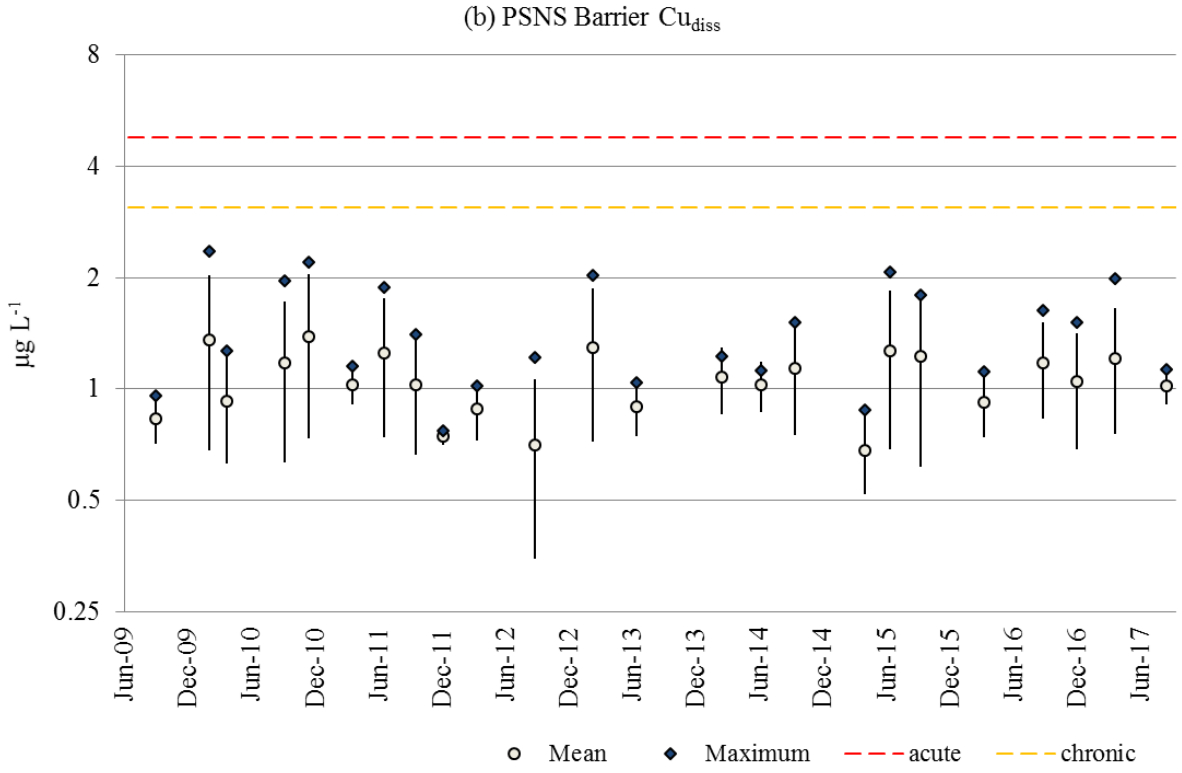

Figure 16. (contd)

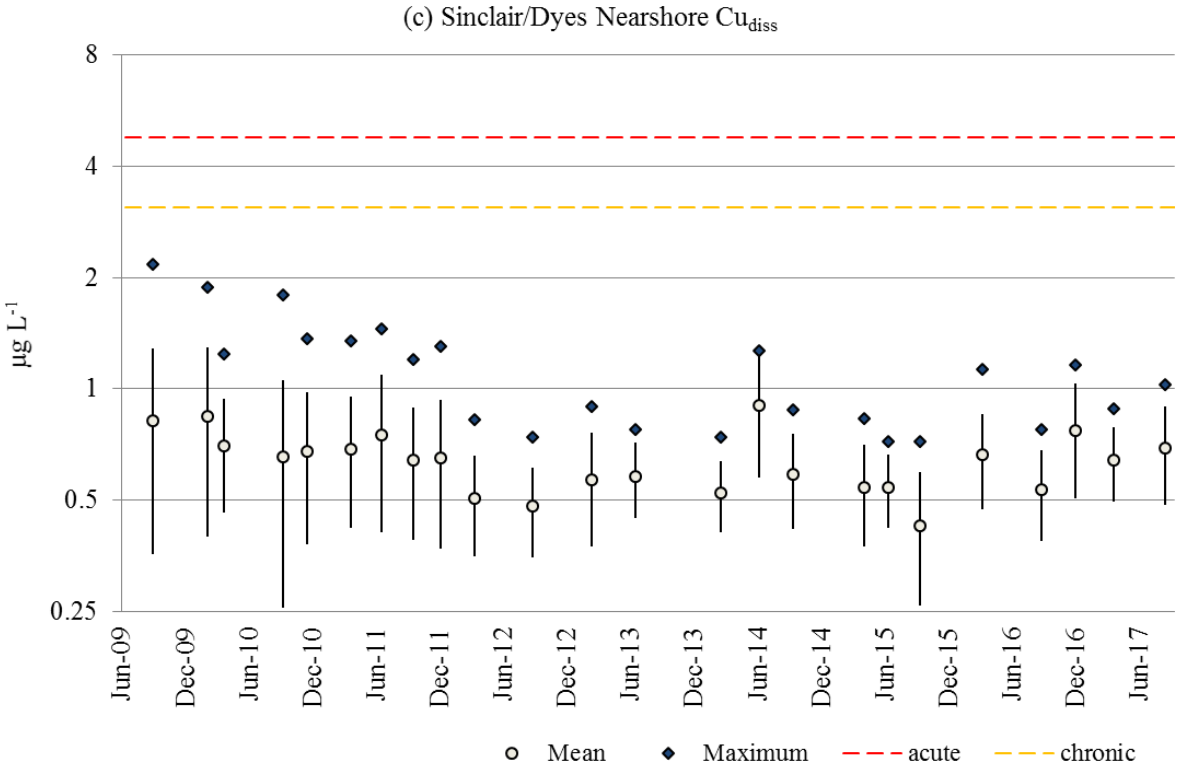

Figure 16. (contd)

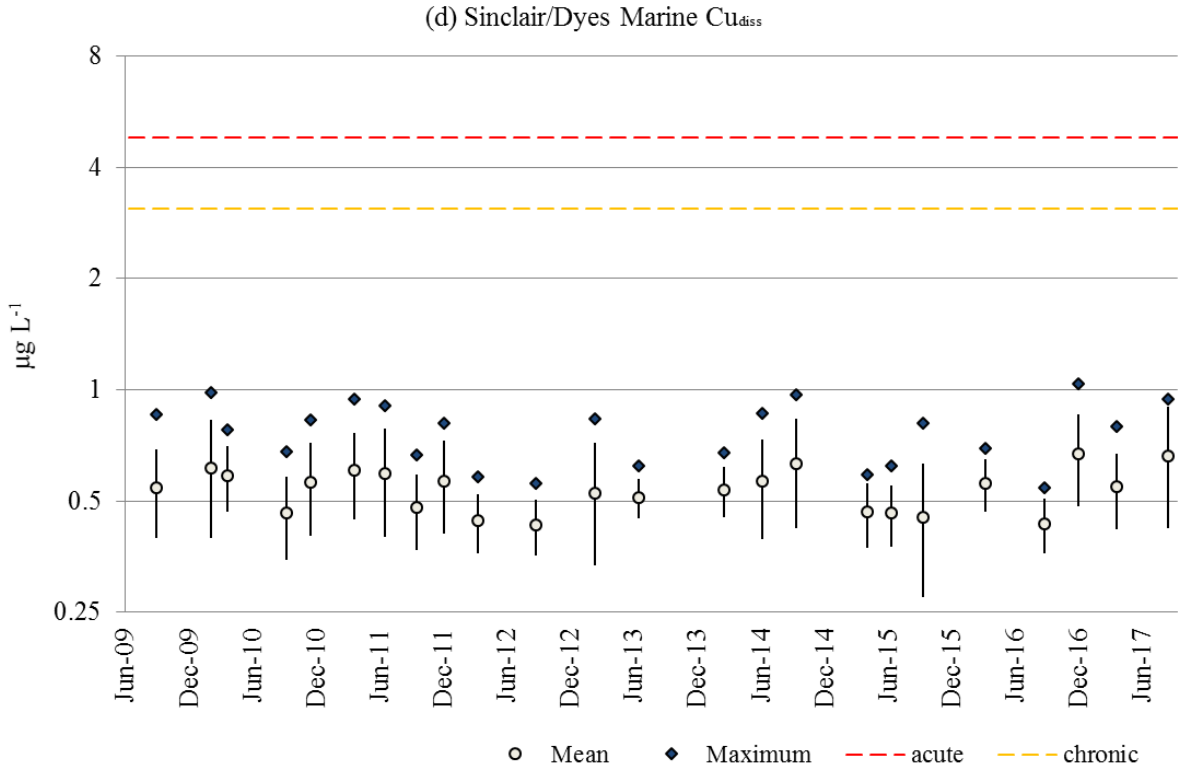

Figure 16. (contd)

Lead

Dissolved Pb surface water samples designated as PSNS Nearshore have averaged (0.0270 ± 0.0101 µg L^{-1} Pb_{diss}) over time; PSNS Barrier (0.0208 ± 0.00461µg L^{-1} Pb_{diss}); Sinclair/Dyes Nearshore (0.0270 ± 0.0101 µg L^{-1} Pb_{diss}); and Sinclair/Dyes Marine (0.0207 ± 0.00461 µg L^{-1} Pb_{diss}) (Figure 17). Pb_{diss} has remained an order of magnitude below the marine toxics substances criteria in all areas of Sinclair and Dyes Inlets, and is not an imminent concern.

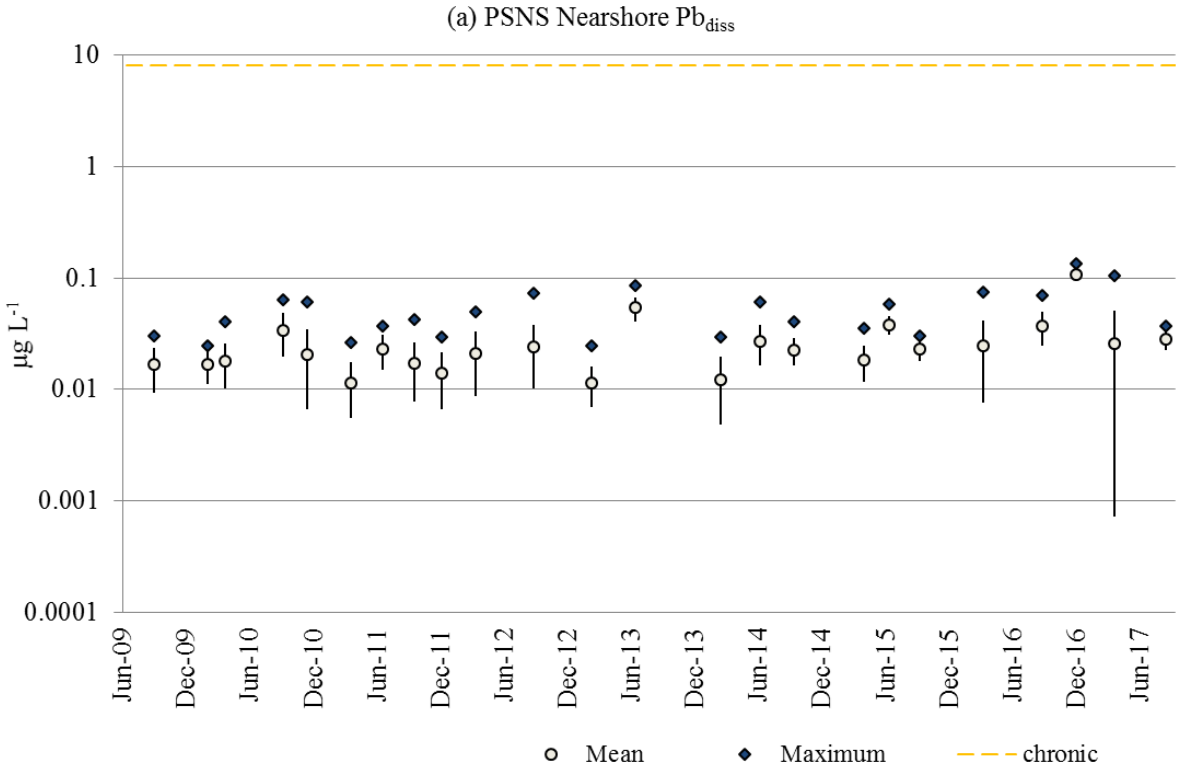

Figure 17. Pb_{diss} trend over 8 years (24 sampling events) with stations divided in four areas: (a) PSNS Nearshore (n = 357), (b) the PSNS Barrier (n = 95), (c) the Sinclair/Dyes Nearshore (n = 250), and (d) the Sinclair/Dyes Marine (n = 179). Open circles are the mean values; diamonds are the maxima.

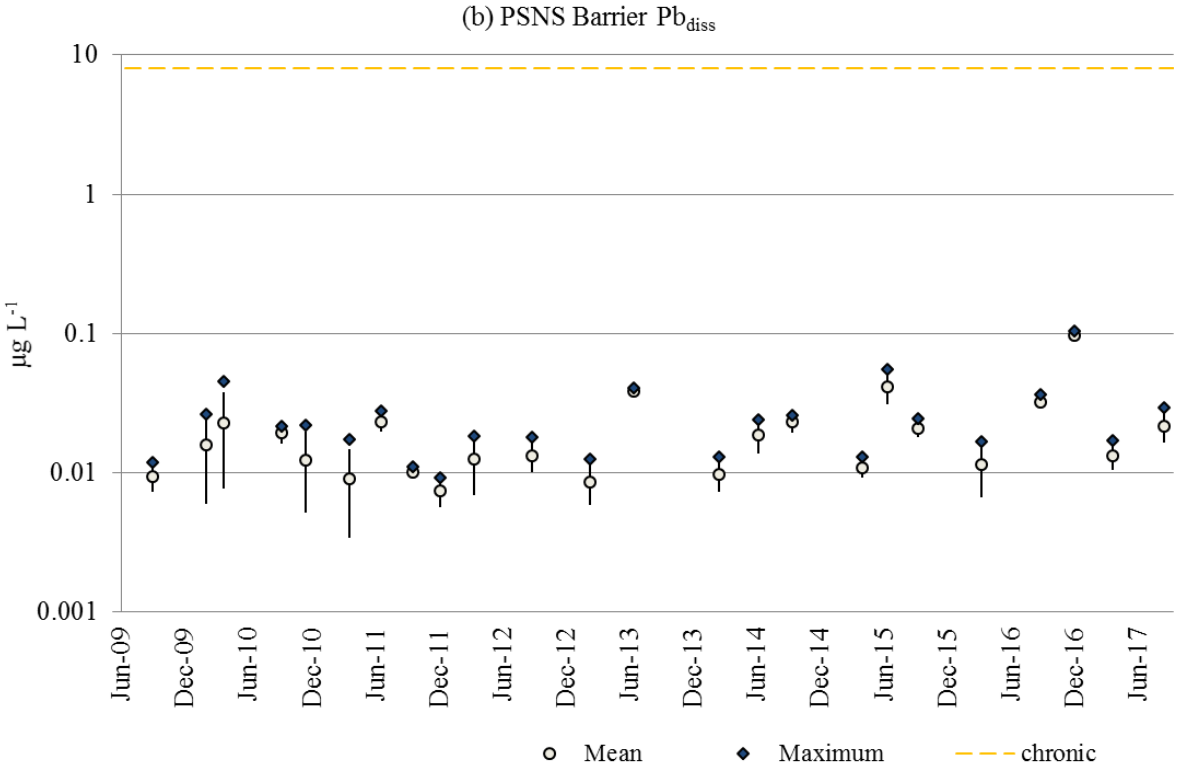

Figure 17. (contd)

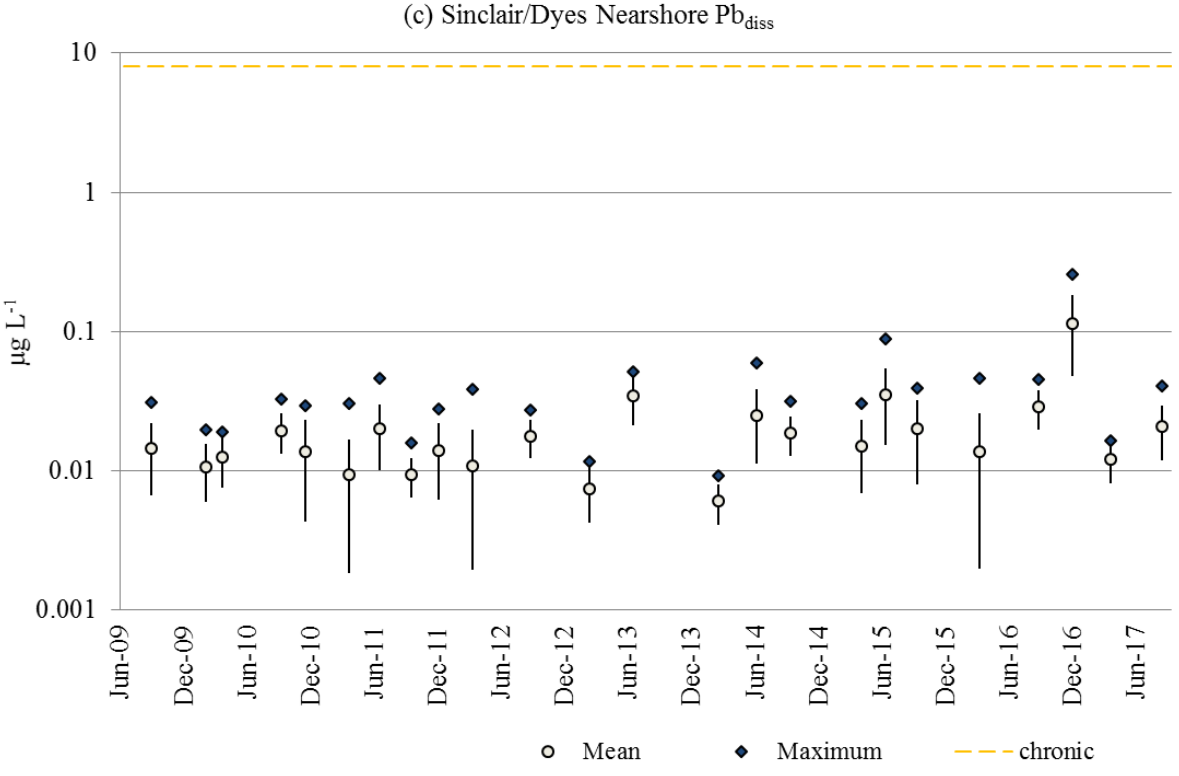

Figure 17. (contd)

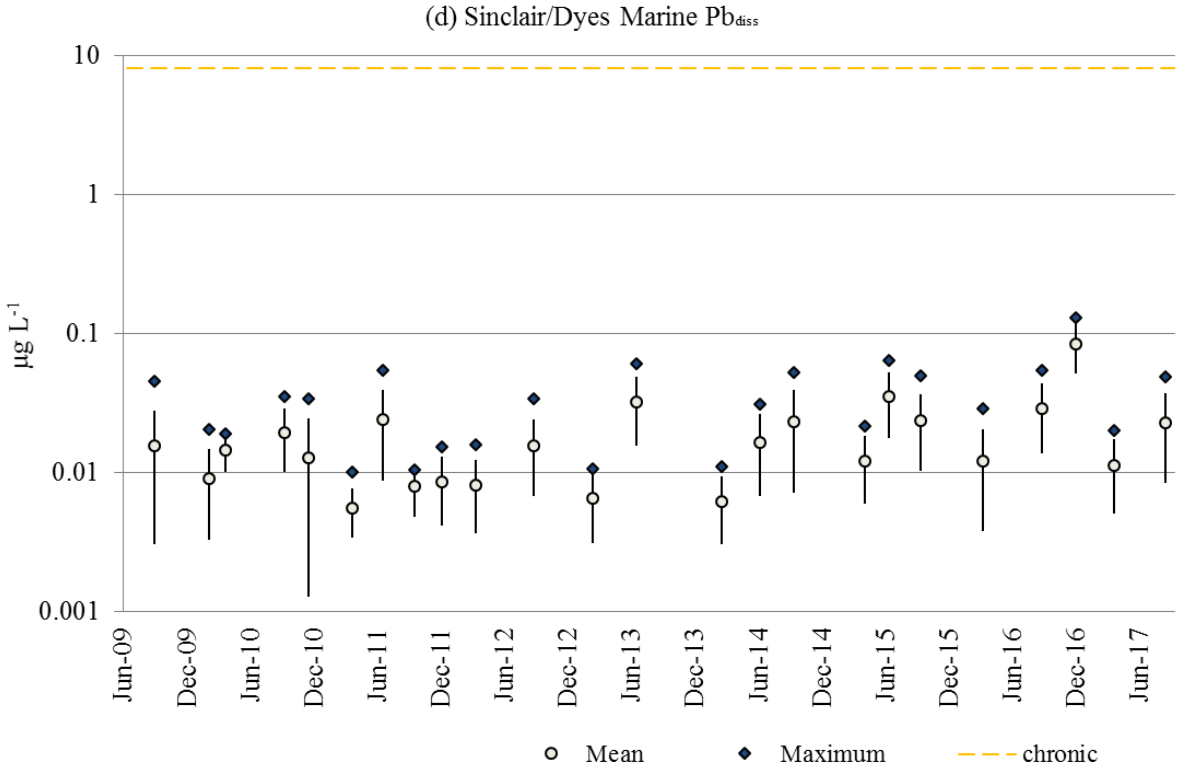

Figure 17. (contd)

Zinc

Dissolved Zn surface water samples designated as PSNS Nearshore have averaged (5.34 ± 2.61 µg L^{-1} Zn_{diss}) over time; PSNS Barrier (3.06 ± 1.31 µg L^{-1} Zn_{diss}); Sinclair/Dyes Nearshore (1.89 ± 1.34 µg L^{-1} Zn_{diss}); and Sinclair/Dyes Marine (1.17 ± 0.553 µg L^{-1} Zn_{diss}) (Figure 18). Average Zn_{diss} has remained well below the marine toxics substances criteria in all areas of Sinclair and Dyes Inlets, and is not an imminent concern. The stations with the greatest load were ILSP (39.1, 10/8/2009), PS11 (27.0, 7/16/2015), PS09 (24.7, 3/5/2013), PS16 (22.9, 1/12/2012), and PS04 (22.3, 3/27/2012).

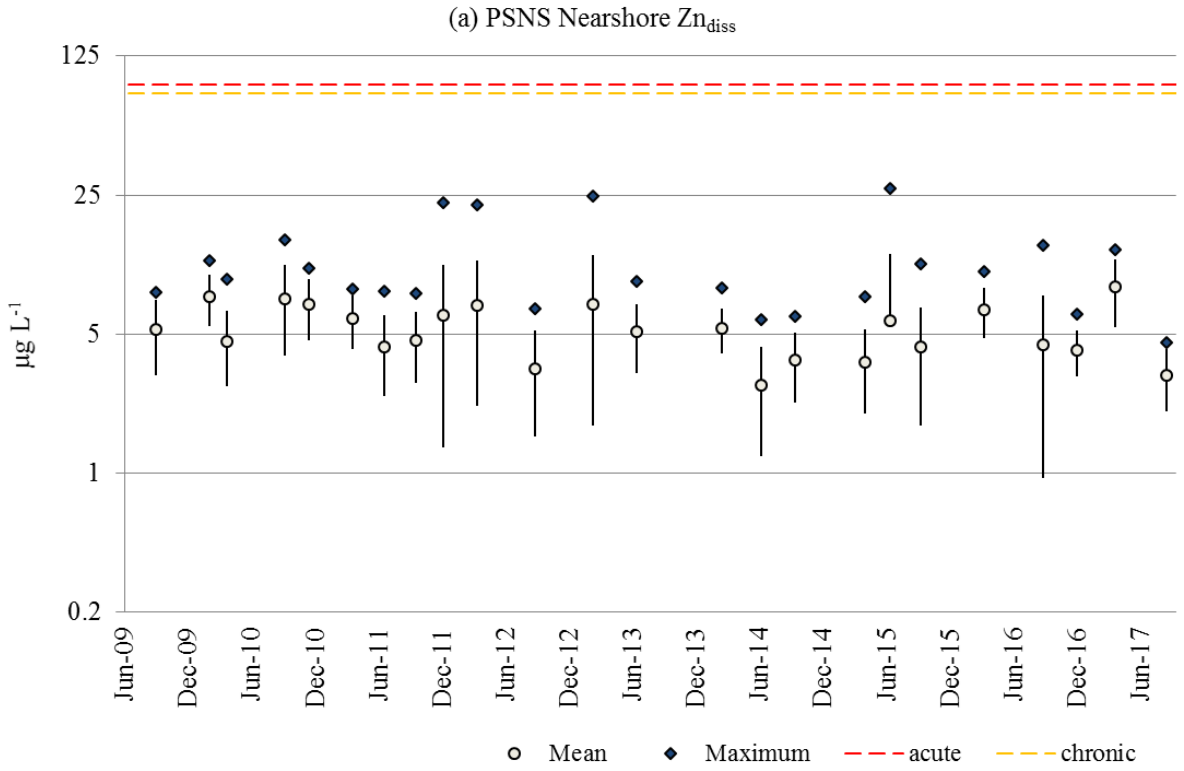

Figure 18. Zn_{diss} trend over 8 years (24 sampling events) with stations divided in four areas: (a) PSNS Nearshore (n = 357), (b) the PSNS Barrier (n = 95), (c) the Sinclair/Dyes Nearshore (n = 250), and (d) the Sinclair/Dyes Marine (n = 179). Open circles are the mean values; diamonds are the maxima.

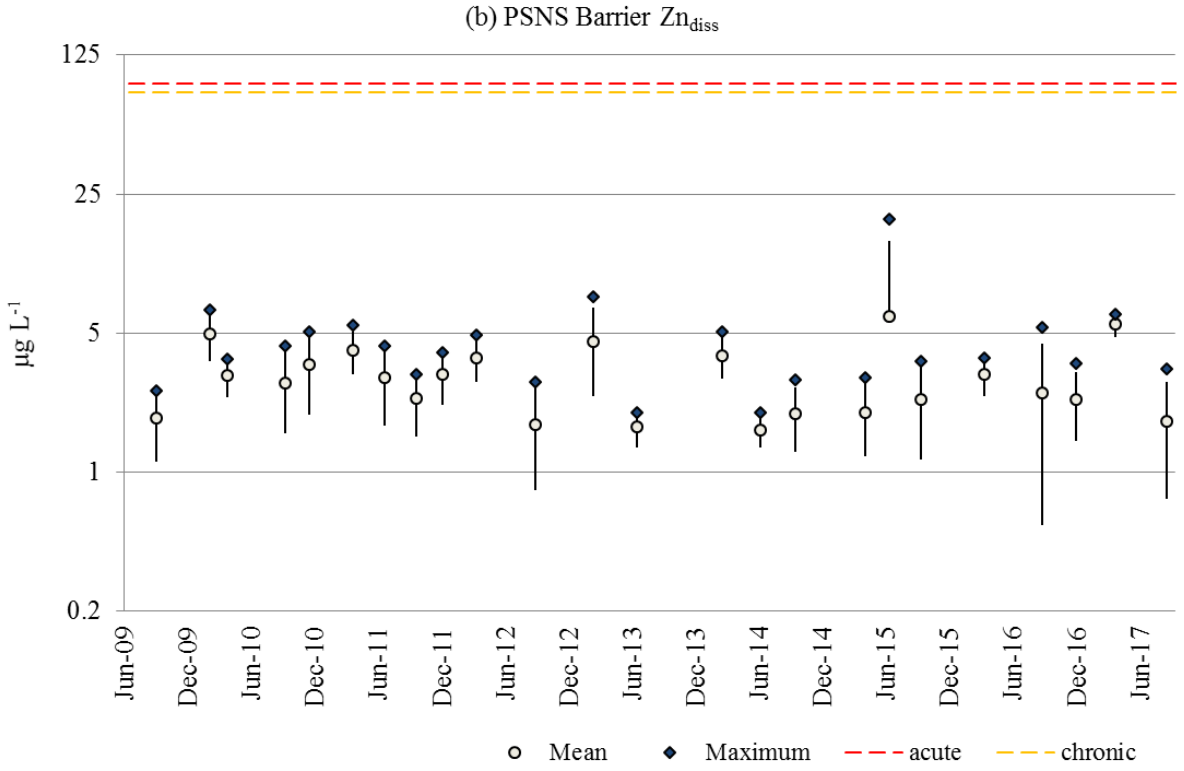

Figure 18. (contd)

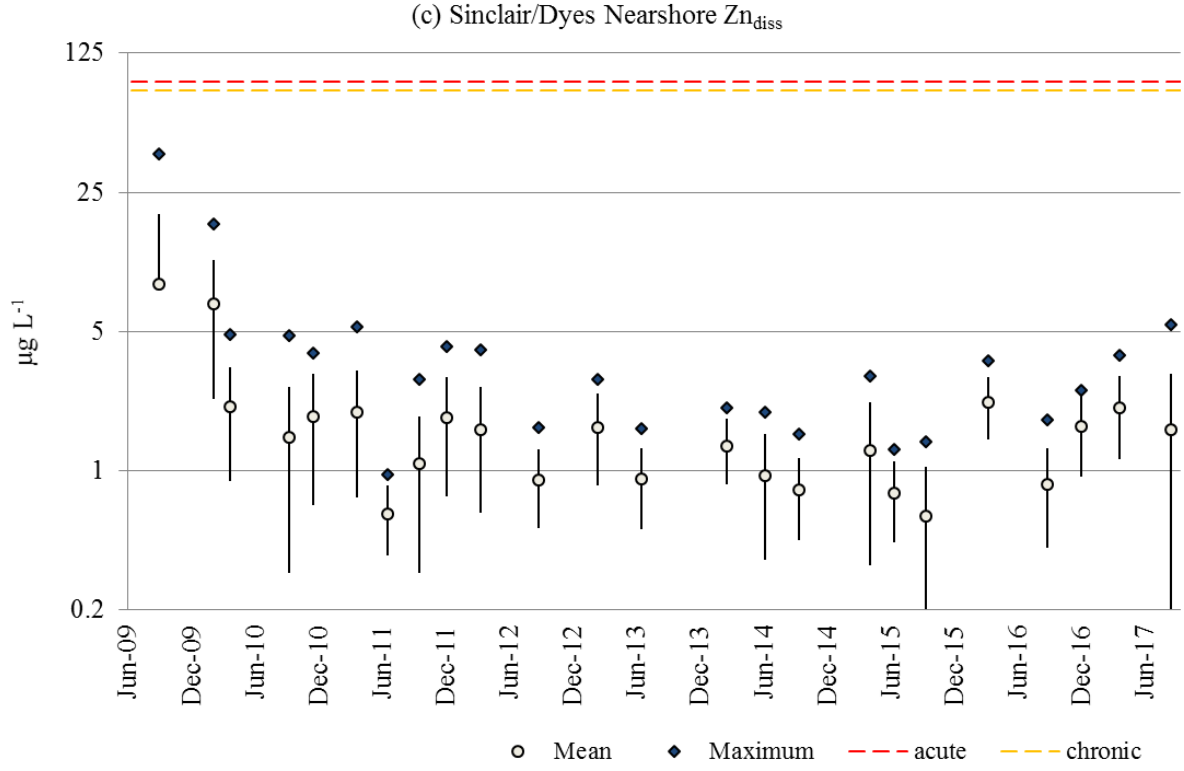

Figure 18. (contd)

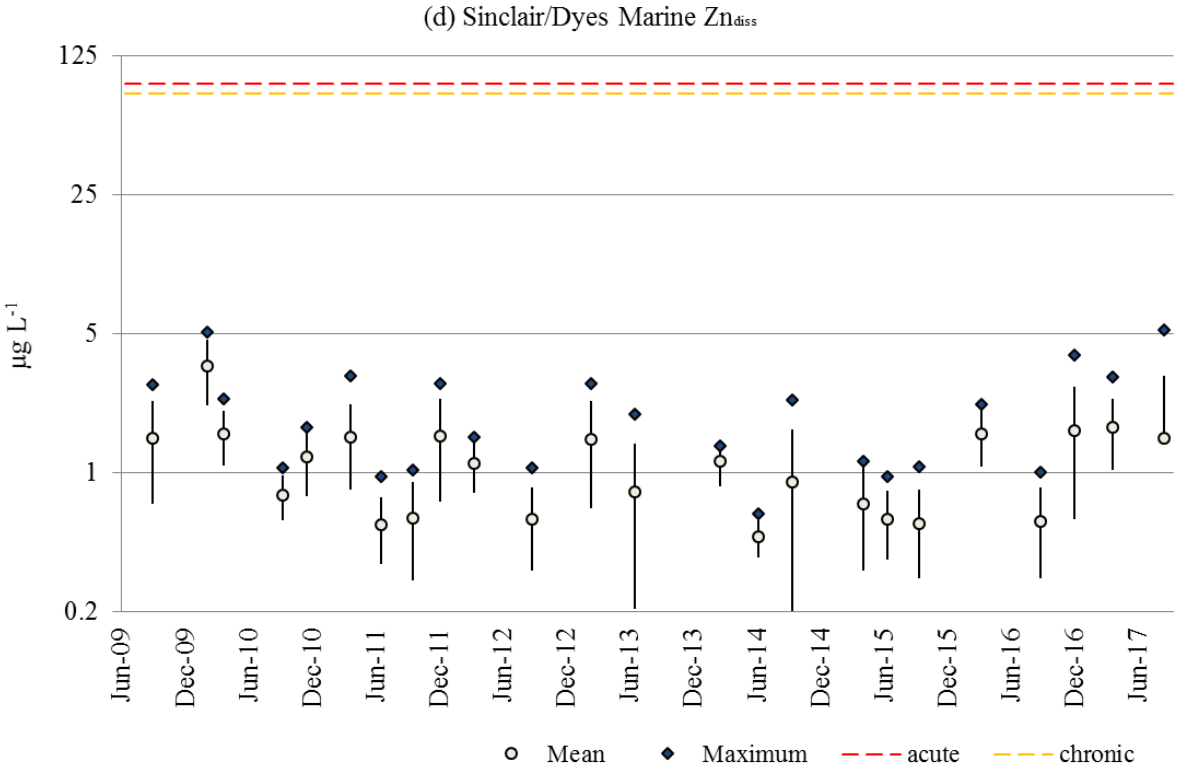

Figure 18. (contd)

5.1.2.2 Seasonal

Marine water samples were categorized by preceding precipitation to elucidate observable effects. Each event was classified as a wet (November–April) or dry (May–October) period, and further codified as 1) wet weather base flow (WWBF): >72 hours after measurable precipitation >0.25 in./24hr; 2) wet weather storm event (WWSE): >0.25 in. of rain within a 24-hour period, following a discernable period of no rainfall; 3) dry weather event (DWE): <0.25 in. of rain in the previous 72 hours; or 4) a dry weather storm event (DSWE): >0.25 in. of rain in the previous 72 hours. Rainfall had no statistically significant effects on concentrations within water affected by industrial outfalls (PSNS Nearshore zone) [$F_{(3,20)} = 4.84$, $p = 0.011$], with the exception of Zn (Table 10); meaning effluent and ambient trace metal levels of Hg, Cu, and Pb are mainly tied to concurrent industrial activities, biological processes, or dissolved organic matter/particulate binding potential.

Rain classifications were determined as relevant to capture precipitation impact significance to in-pipe quality parameters such as TSS due to cumulative antecedent precipitation in previous work by Project ENVVEST (Brandenberger et al. 2017).

Table 10. Post hoc Tukey of Zn_{diss} as PSNS Nearshore average concentrations over 24 sampling events categorized by antecedent rainfall designation.

Contrast	Difference	Pr > Diff	Significant	Lower Bound (95%)	Upper Bound (95%)
WWSE vs DWE	2.68	0.013	Yes	0.500	4.85
WWSE vs WWBF	1.10	0.536	No	-1.16	3.35
WWSE vs DWSE	0.799	0.895	No	-2.39	3.99

DWSE vs WWBF	0.297	0.992	No	-2.61	3.21
WWBF vs DWE	1.58	0.084	No	-0.165	3.32

5.2 Outfall Water

Temporal variance of metals regulated under the NPDES are plotted as total values, and supplemented with dissolved values. WA00206-2 limitations are depicted for Cu. Summary trace metals and physicochemical parameters of composite samples are provided in Appendix B Table B.6.

Supporting plots are provided depicting boxplot statistics of OF019 discrete samples for characterization of variation over 6 selected 24-hour periods during which wedge bottle series were collected in lieu of a single composite; OF019 is the discharge of DD06, and the sampling period was designed to capture numerous pump-down cycles associated with ship movements.

5.2.1 Mercury

OF018 Hg_{tot} averaged 0.0116 ± 0.00837 µg L^{-1} and Hg_{diss} averaged 0.00297 ± 0.00126 µg L^{-1} over the 8 years captured in Figure 19. OF019 Hg_{tot} averaged 0.007599 ± 0.00518 µg L^{-1} post removal of an outlier during AMB11 (85 ng L^{-1}); this outlier was associated with particulates collected as a result of manual override of the pump, which resulted in lower than normal water levels in the pump-well as supported by the dissolved concentration. Dissolved Hg averaged 0.00240 ± 0.00139 µg L^{-1}. The OF021, post AMB07, Hg_{tot} averaged 0.00288 ± 0.000602 µg L^{-1} and Hg_{diss} averaged 0.00203 ± 0.000578 µg L^{-1} (n = 17). Pre AMB07, Hg_{tot} averaged 0.0505 ± 0.0490 µg L^{-1} and Hg_{diss} averaged 0.0103 ± 0.0155 µg L^{-1} (n = 7). This shift reflects PSNS-implemented BMPs at the steam-plant facility (moving to a reverse osmosis method). No NPDES limits are currently in place for this analyte.

The variance among 24-hour composites seen in Figure 20 is significant [$F_{(5,106)} = 4.48$, $p = <0.001$], and shows that shifts in effluent Hg_{tot} ranging from means of 0.00778 µg L^{-1} to 0.0192 µg L^{-1} are to be expected during ship dockings.

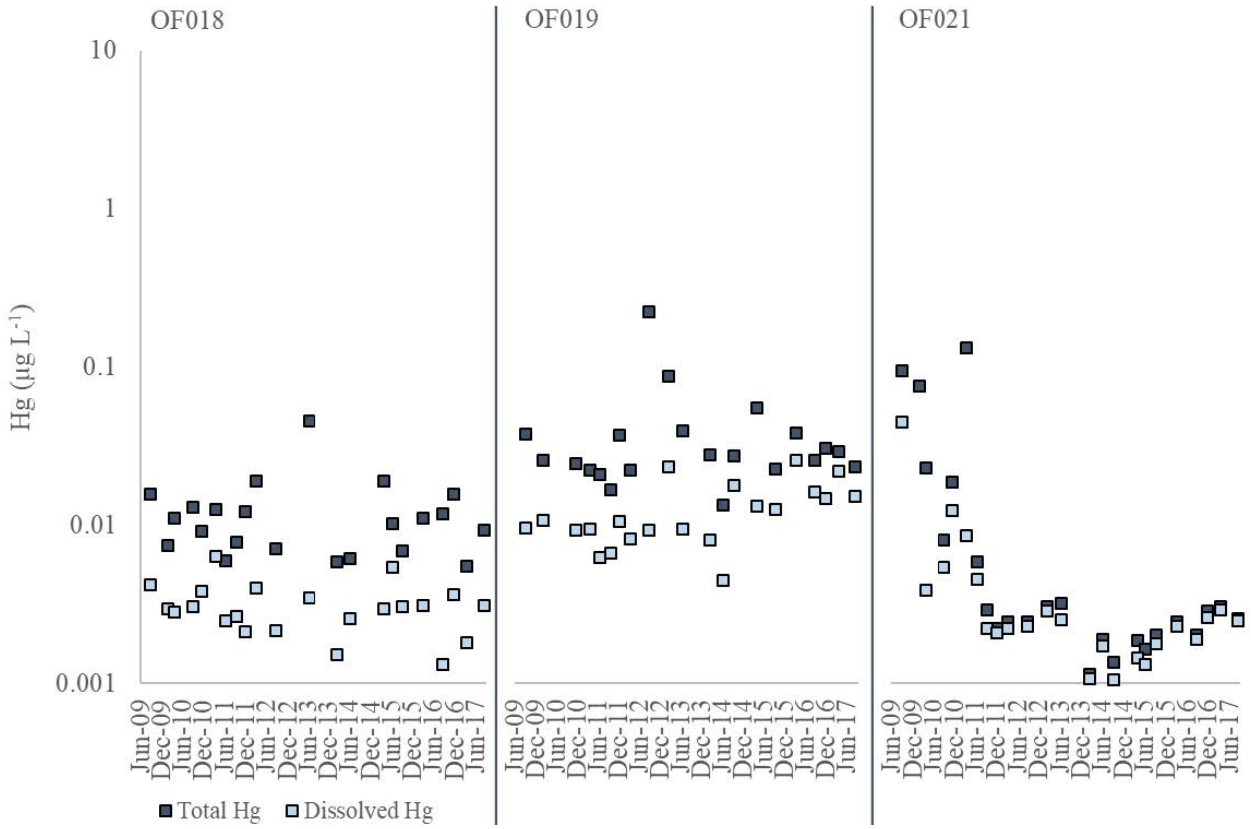

Figure 19. Hg_{diss} and Hg_{tot} at ENVVEST monitored outfalls over the course of 24 events spanning 8 years (n = 23, 21, and 24, respectively).

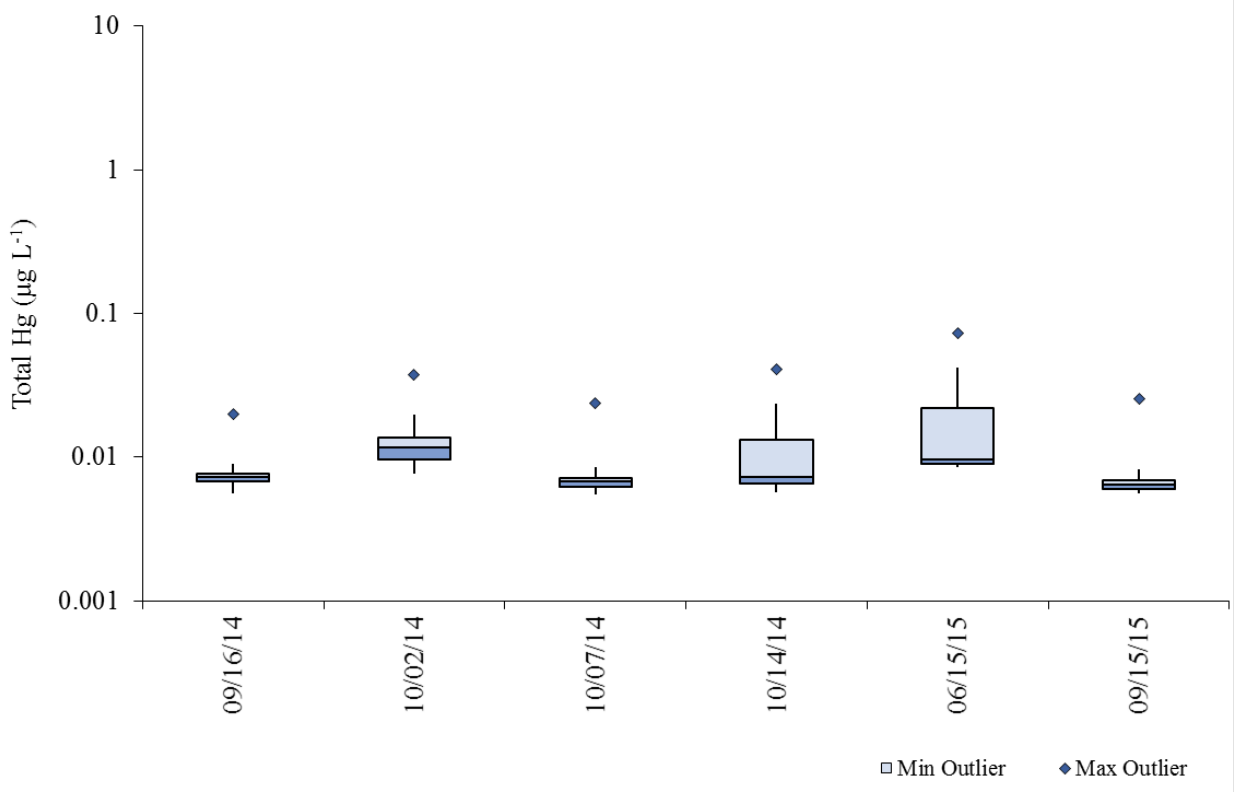

Figure 20. Hg_{tot} in selected events for 24-hour temporal analysis of OF019 discharge (n = 20, 24, 19, 20, 18, and 14, respectively).

5.2.2 Copper

OF018 Cu_{tot} averaged 7.46 ± 6.07 µg L^{-1} and Cu_{diss} averaged 3.37 ± 1.58 µg L^{-1} over the 8 years captured in Figure 21. OF019 Cu_{tot} averaged 5.04 ± 5.29 µg L^{-1} post removal of an outlier during AMB11 (200 µg L^{-1}); this outlier was associated with particulates collected as a result of manual override of the pump, which resulted in lower than normal water levels in the pump-well as supported by the dissolved concentration. Dissolved Cu averaged 2.02 ± 1.59 µg L^{-1}. The OF021, post AMB07, Cu_{tot} averaged 1.15 ± 0.480 µg L^{-1} and Cu_{diss} averaged 1.04 ± 0.424 µg L^{-1} (n = 17). Pre AMB07, Cu_{tot} averaged 9.15 ± 3.89 µg L^{-1} and Cu_{diss} averaged 1.99 ± 2.35 µg L^{-1} (n = 7). This shift reflects PSNS -implemented BMPs at the steam-plant facility. AMB11 OF019 (08/28/12) was the only Cu exceedance of NPDES limits.

The variance among 24-hour composites seen in Figure 22 is significant [$F_{(5,106)}$ = 11.0, p = <0.0001], and shows that shifts in effluent Cu_{tot} ranging from means of 1.88 µg L^{-1} to 4.43 µg L^{-1}, with a maximum of 9.18 µg L^{-1} are to be expected during docking events.

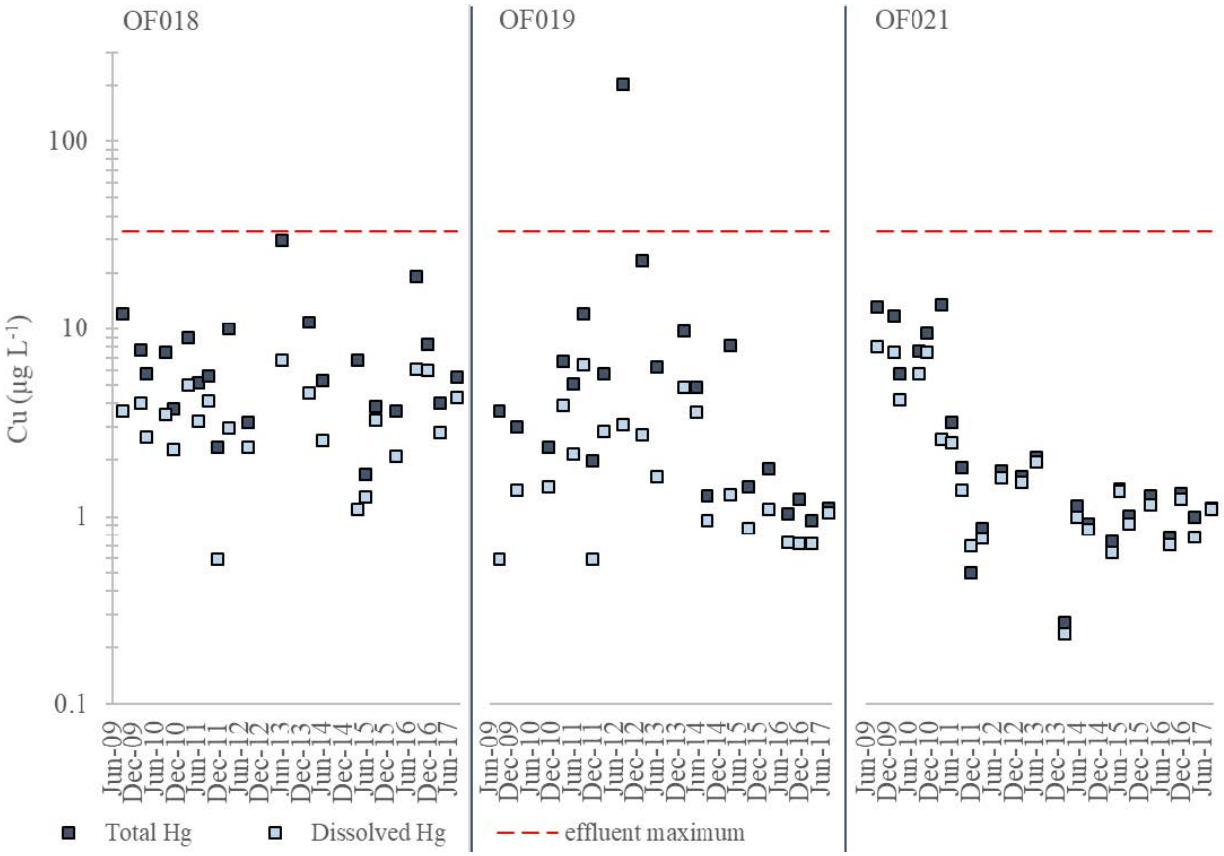

Figure 21. Cu_{diss} and Cu_{tot} at ENVVEST monitored outfalls over the course of 24 events spanning 8 years.

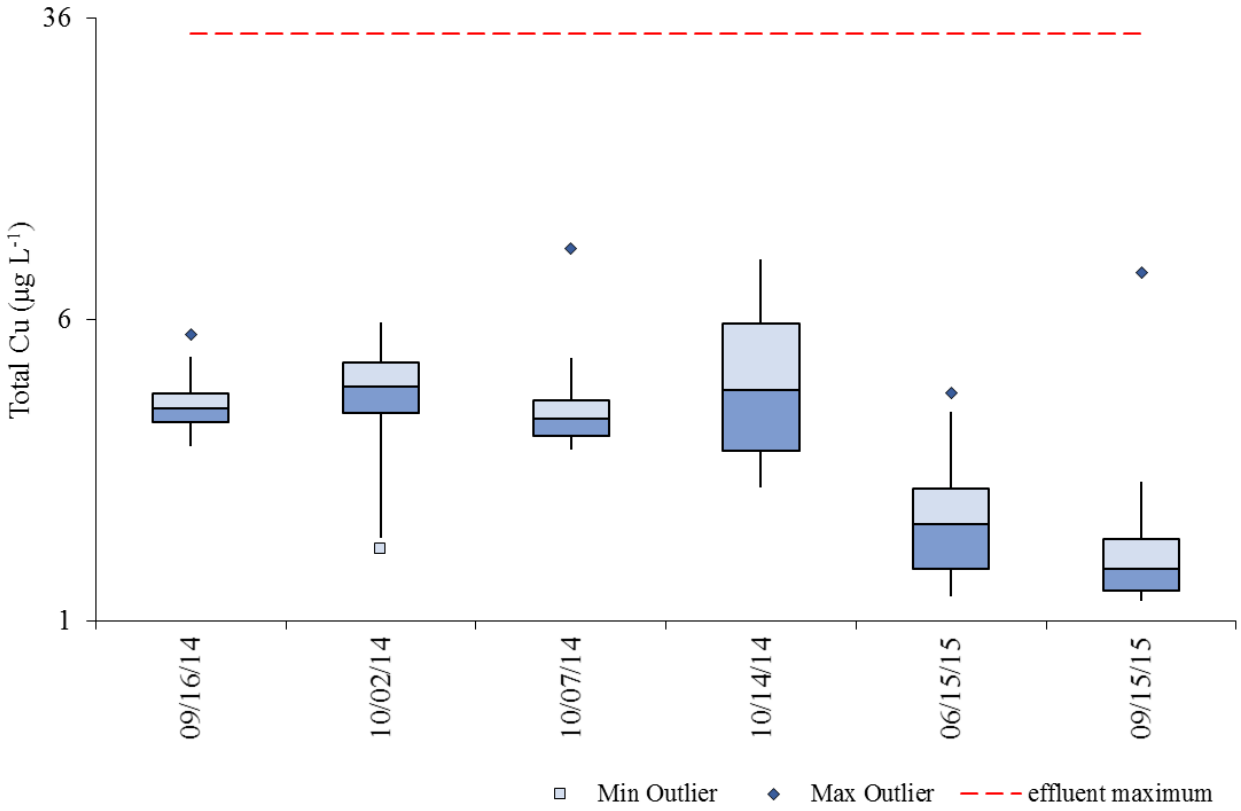

Figure 22. Cu_{tot} in selected events for 24-hour temporal analysis of OF019 discharge (n = 20, 24, 19, 20, 18, and 14, respectively).

5.2.3 Lead

OF018 Pb_{tot} averaged 0.458 ± 0.590 µg L^{-1} and Pb_{diss} averaged 0.0173 ± 0.0117 µg L^{-1} over the 8 years captured in Figure 23. OF019 Pb_{tot} averaged 0.286 ± 0.375 µg L^{-1} after removal of an outlier during AMB11 (9.06 ug L^{-1}); this outlier was associated with particulates collected as a result of manual override of the pump, which resulted in lower than normal water levels in the pump-well as supported by the dissolved concentration. Dissolved Pb averaged 0.00393 ± 0.0130 µg L^{-1}. The OF021, post AMB07, Pb_{tot} averaged 0.0118 ± 0.00832 µg L^{-1} and Pb_{diss} averaged 0.0799 ± 0.0983 µg L^{-1} (n = 17). Pre AMB07, Pb_{tot} averaged 0.600 ± 0.373 µg L^{-1} and Pb_{diss} averaged 0.00551 ± 0.00314 µg L^{-1} (n = 7). This shift reflects PSNS-implemented BMPs at the steam-plant facility. No NPDES limits are currently in place for this analyte.

The variance among 24 hour composites seen in Figure 24 is significant [$F_{(5,106)} = 4.08$, $p = 0.002$], and shows that shifts in effluent Pb_{tot} ranging from means of 0.0410 µg L^{-1} to 0.199 µg L^{-1}, with a maximum of 1.13 µg L^{-1} are to be expected during docking events.

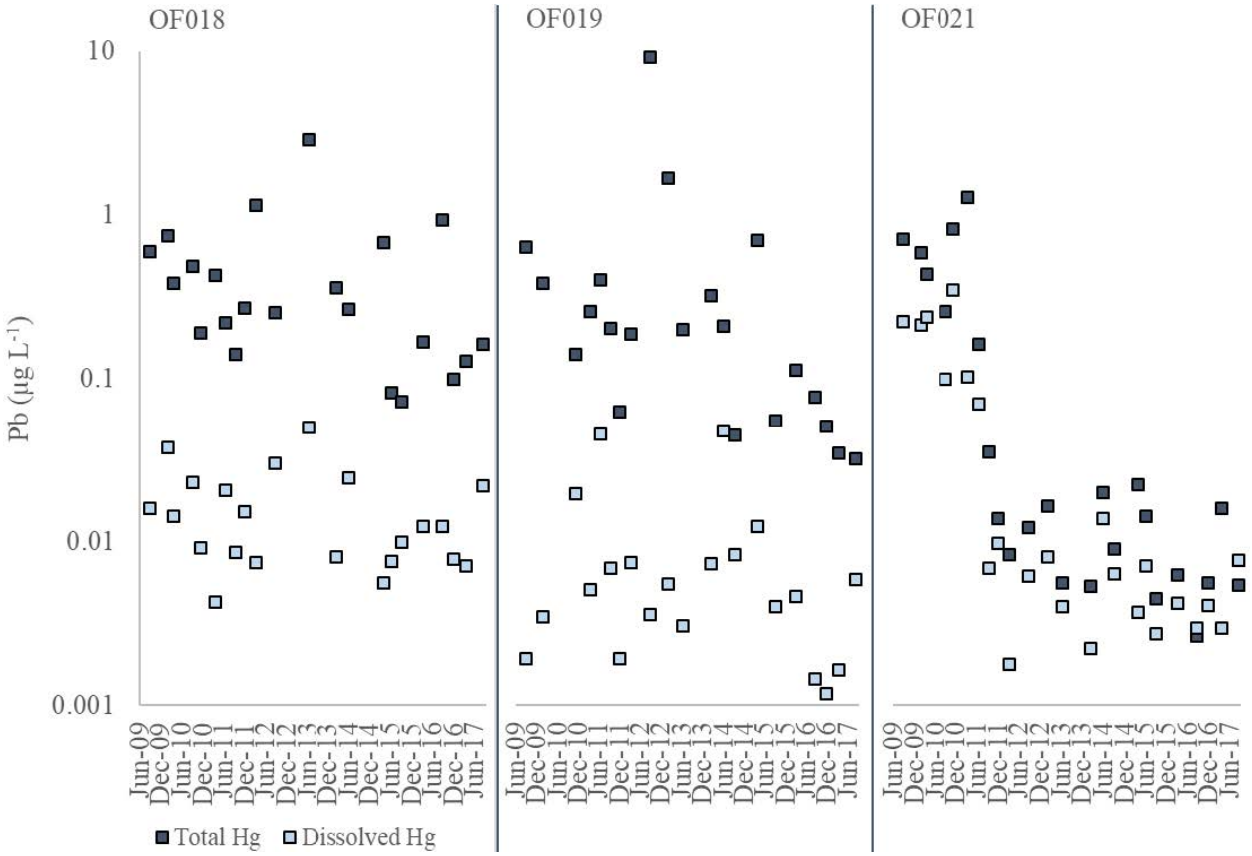

Figure 23. Pb_{diss} and Pb_{tot} at ENVVEST monitored outfalls over the course of 24 events spanning 8 years.

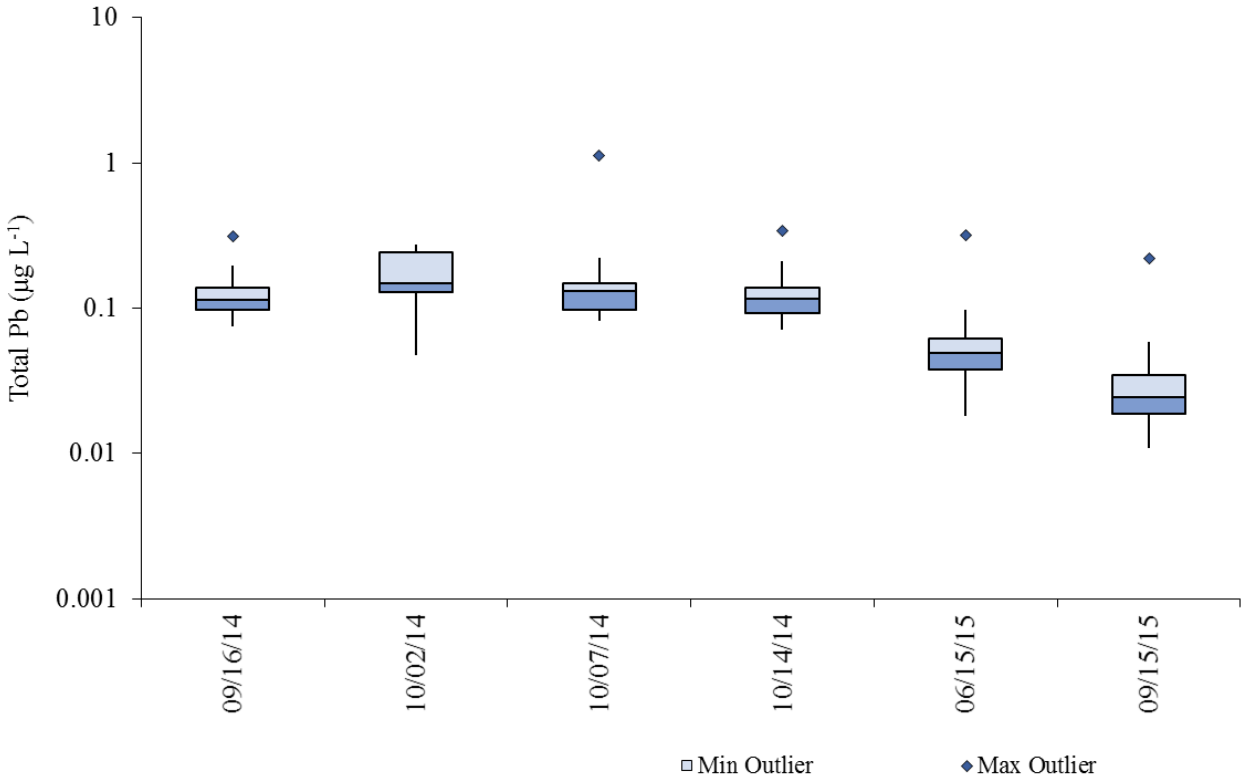

Figure 24. Pb_{tot} in selected events for 24-hour temporal analysis of OF019 discharge (n = 20, 24, 19, 20, 18, and 14, respectively).

5.2.4 Zinc

OF018 Zn_{tot} averaged 35.8 ± 14.0 µg L^{-1} and Zn_{diss} averaged 29.1 ± 8.55 µg L^{-1} over the 8 years captured in Figure 25. OF019 Zn_{tot} averaged 23.5 ± 16.9 µg L^{-1} after removal of an outlier during AMB11 (365 ug L^{-1}); this outlier was associated with particulates collected as a result of manual override of the pump which resulted in lower than normal water levels in the pump-well as supported by the dissolved concentration. Dissolved Zn averaged 16.0 ± 6.25 µg L^{-1}. The OF021, post AMB07, Zn_{tot} averaged 0.743 ± 0.462 µg L^{-1} and Zn_{diss} averaged 0.730 ± 0.396 µg L^{-1} (n = 17). Pre AMB07, Zn_{tot} averaged 7.48 ± 3.35 µg L^{-1} and Zn_{diss} averaged 1.91 ± 2.52 µg L^{-1} (n = 7). This shift reflects PSNS-implemented BMPs at the steam-plant facility. No NPDES exceedances were observed for this analyte under the Ambient Monitoring Program's quarterly sampling.

The variance among 24-hour composites seen in Figure 26 is significant [$F_{(5,106)} = 23.5$, $p = <0.0001$], and shows that shifts in effluent Zn_{tot} ranging from means of 10.3 µg L^{-1} to 37.4 µg L^{-1}, with a maximum of 99.9 µg L^{-1} are to be expected during docking events.

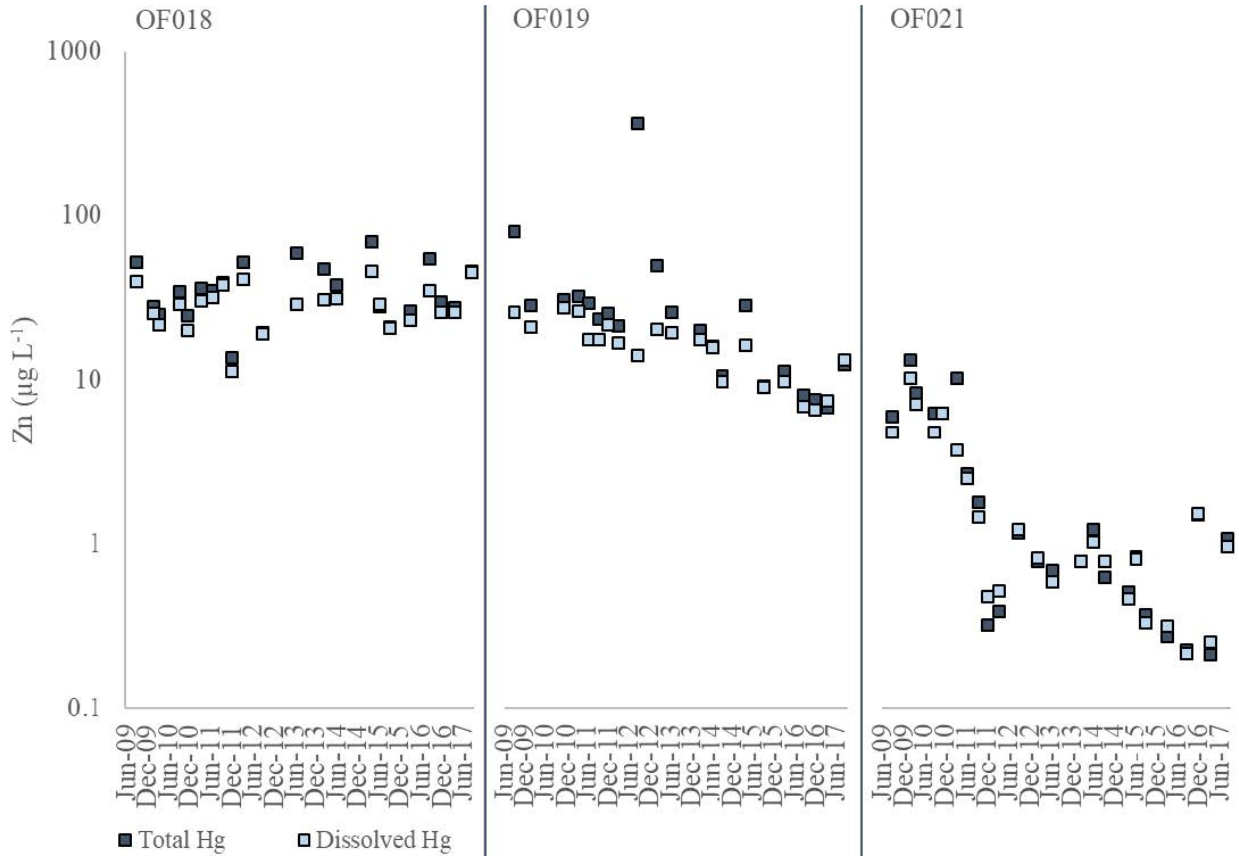

Figure 25. Zn_{diss} and Zn_{tot} at ENVVEST monitored outfalls over the course of 24 events spanning 8 years.

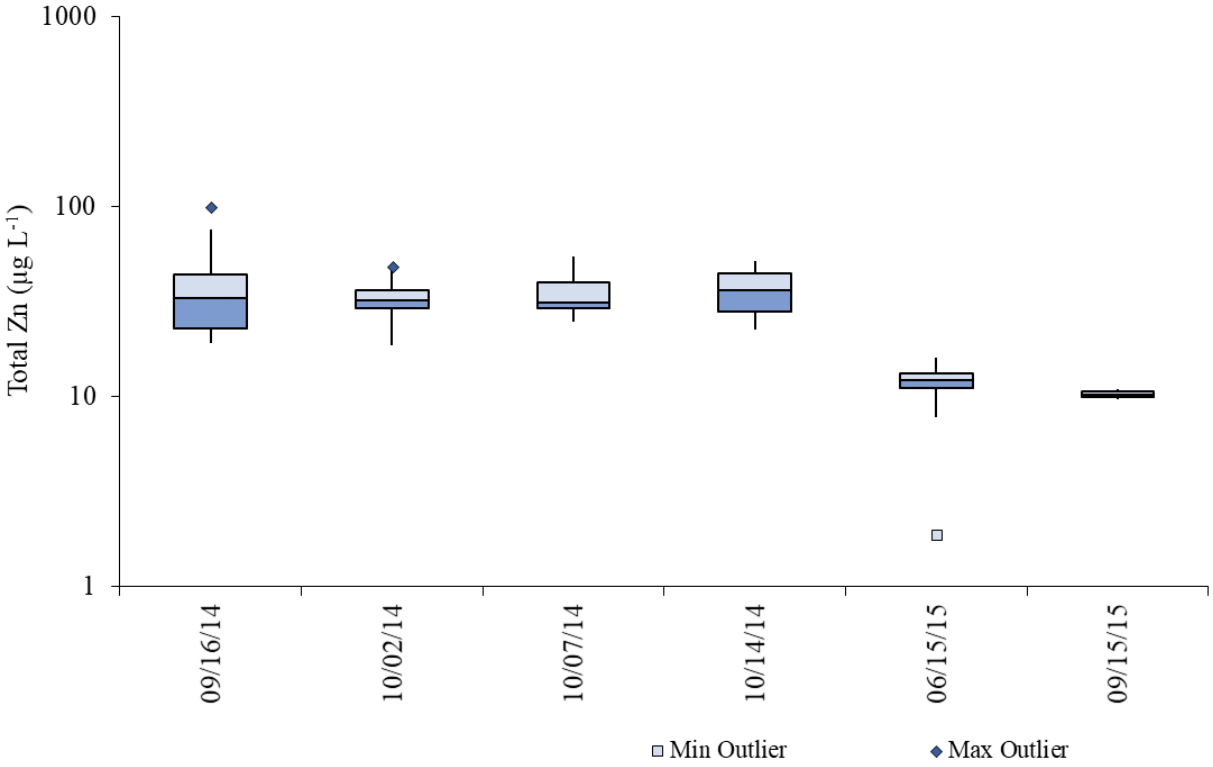

Figure 26. Zn_{tot} in selected events for 24-hour temporal analysis of OF019 discharge (n = 20, 24, 19, 20, 18, and 14, respectively).

Appendix A – Ambient Monitoring QAP Summary

Table A.1. Definitions, requirements, and frequency for typical quality control (QC) samples.

QC Sample	Definition	Frequency
Method or Procedural Blank (MB)	A combination of solvents, surrogates, and all reagents used during sample processing, processed concurrently with the field samples. Monitors purity of reagents and laboratory contamination.	1/sample batch of 20 A processing batch MB must be analyzed with each sequence.
Standard Reference Material (SRM)	An external reference sample that contains a certified level of target analytes; serves as a monitor of accuracy. Extracted and analyzed with samples of a like matrix (not available for all analytes).	1/batch of 20
Matrix Spike (MS)	A field sample spiked with the analytes of interest is processed concurrently with the field samples; monitors effectiveness of method on sample matrix; performed in duplicate.	1/sample batch of 20
Duplicate Sample	Second aliquot of a field sample processed and analyzed to monitor precision; each sample set should contain a duplicate.	1/sample batch of 20
Recovery Internal Standards (RIS)	All field and QC samples are spiked with recovery internal standards just prior to analysis; used to quantify surrogates to monitor extraction efficiency on a per sample basis.	Each sample analyzed for organic compounds

Table A.2. Measurement quality criteria.

QC Parameter	Acceptance Criteria	Corrective Action
Method Blank (MB)	MB<RL If MB>RL; sample values ≤10X MB, then perform corrective action	Perform corrective action re-process (extract, digest) sample batch. If batch cannot be re-processed, notify client and flag data.
Standard Reference Material (SRM)	Determined vs certified range. Analyte concentration must be 10xMDL to be used for DQO. Metals: ≤20% PD Method criteria for all other parameters	Review data to assess impact of matrix. Reanalyze sample and/or document corrective action. If other QC data are acceptable then flag associated data if sample is not reanalyzed.
Matrix Spike (MS)/MS Duplicate (MSD)	Metals: 70–130% recovery Method criteria for all other parameters	Review data to assess impact of matrix. If other QC data are acceptable and no spiking error occurred, then flag associated data. If QC data are not affected by matrix failure or spiking errors occurred, then re-process MS. If not possible, then notify client and flag associated data.
Laboratory Control Sample (LCS)	Metals: <30% RPD Method criteria for all other parameters	Perform corrective action. Reanalyze and/or re-process sample batch. If batch cannot be re-processed: notify client, flag data, discuss impact in report narrative.
Laboratory Duplicates (R2)	Metals: <30% RPD Method criteria for all other parameters	Review data to assess impact of matrix. If other QC data are acceptable, then flag associated data. If QC data are not affected by matrix failure, then re-process the duplicate. If not possible, then notify client and flag associated data.

Table A.3. Sample containers, sample size, preservative requirements, and holding times for analytical samples.

Parameter	Method	Sample Preservation	Holding Time
Total Suspended Solids (TSS)	MSL-I-041	4ºC	7 days
Total Organic Carbon (TOC)	MSL-W-011	-20°C, or HCl to pH <2	28 days or 7 days
Dissolved Organic Carbon (DOC)	MSL-W-011	-20°C, or HCl to pH <2	28 days or 7 days
Total/Dissolved Hg	MSL-I-013	HNO_3 pH<2.0	90 days
Total/Dissolved Al	MSl-I-022	HNO_3 pH<2.0	6 months
Total/Dissolved As	MSl-I-030	HNO_3 pH<2.0	6 months
Total/Dissolved Cd	MSl-I-022	HNO_3 pH<2.0	6 months
Total/Dissolved Cr	MSl-I-022	HNO_3 pH<2.0	6 months
Total//Dissolved Cu	MSl-I-022	HNO_3 pH<2.0	6 months
Total/Dissolved Pb	MSl-I-022	HNO_3 pH<2.0	6 months
Total/Dissolved Ag	MSl-I-022	HNO_3 pH<2.0	6 months
Total/Dissolved Zn	MSl-I-022	HNO_3 pH<2.0	6 months

Appendix B – Supporting Data

Table B.1. Summary statistics of analytical accuracy and precision for analytes of interest.

	Cu	Pb	Zn	Hg
LCS Percent Recovery (%)

Maximum	14%	76%	139%	46%
STD	3%	7%	12%	7%

(a) The appropriate fortification level to represent potential matrix interferences is 2–5x the native sample concentration. To assess matrix interference, the target fortification levels should be no greater than 10 times the native concentrations. When MS did not fall between 2–10x the native concentration data were not included in statistics.

Table B.2. Summary statistics of analytical accuracy and precision for ancillary trace metals.

* Coordinates are listed as target locations
† Analyte not sampled post-AMB14; determined to be non-concern
‡ Analyte not sampled post-AMB11; determined to be non-concern
§ Parameter not sampled post-AMB05; determined to be non-concern
‖ Parameter not sampled post-AMB22; determined to be non-concern
¶ Collected below seasonal thermocline
☞ Non-detects are included as method detection limits

Appendix C – Analytical Chemistry Data Packages

Analytical Chemistry Data Package

Project: ENVVEST Ambient Monitoring August 2009
(Final 052010)

Battelle Project No. 54220
CF No. 3060

Marine Sciences Laboratory
1529 West Sequim Bay Road
Sequim, WA 98382
PM: Jill Brandenberger
(360) 681-4564

CHEMISTRY ANALYSIS
DATA PACKAGE CONTENTS

ENVVEST Ambient Monitoring
Seawater Chemistry,
Equipment Blanks

Inorganic Chemistry Analysis of Metals in Site Water
Field Data Summary Report 3
QA/QC Summary Reports 12
QA/QC Narrative 29

Sample Custody Information
Laboratory Sample Log-In Form 33
Chain of Custody Form 41
Log-In Checklist 66

CVAF Analysis of Samples for Hg
Analytical raw data available upon request

FIAS Analysis of Samples for As
Analytical raw data available upon request

ICP-MS Analysis of Samples for Metals
Analytical raw data available upon request

Analysis of Conventional Water Chemistry in Site Water
Narrative, Batch K0908111 69
Summary Report, Batch K0908111 70

Narrative, Batch K0908264 149
Summary Report, Batch K0908264 150

Sample Custody Information
Chain of Custody Form, Batch K0908111 143
Log-In Checklist, Batch K0908111 148

Chain of Custody Form, Batch K0908264 216
Log-In Checklist, Batch K0908264 221

Field Custody Forms (AMB01-XX) 222

Analytical raw data available upon request

BATTELLE MARINE SCIENCE LABORATORIES

QA/QC NARRATIVE

PROJECT: Sinclair and Dyes Inlet Ambient Monitoring, August 2009

PARAMETER: Total and Dissolved Metals – Al (Total only), Ag, As, Cd, Cr, Cu, Pb, Zn and Hg

LABORATORY: Battelle Marine Sciences Laboratory (MSL), Sequim, Washington

MATRIX: Seawater and Equipment Blanks

SAMPLE CUSTODY AND PROCESSING: Samples were collected from Sinclair and Dyes Inlet by MSL and the U.S. Navy on 08/31/09 and 09/01/09. Samples were also collected by MSL at Keyport Lagoon on 08/06/09. Samples were hand delivered the day of collection to MSL by the field team. All samples were received in good condition. Samples were assigned a Battelle Central File (CF) identification number (3060) and were entered into Battelle's sample tracking system. Upon receipt at MSL, each sample was shaken vigorously and approximately 500mL was filtered through a pre-cleaned 0.45µm polyvinylidene fluoride (PVDF) filter membrane inside a class 100 clean bench. The dissolved and total fractions were both acidified to a pH of < 2.0 with double distilled nitric acid.

The following lists information on sample receipt and processing activities:

Sample Receipt Dates:	08/06/09 Keyport Lagoon 08/31/09 and 09/01/09
Cooler temp. on arrival	4.0±2°C
Collection dates	08/06/09 Keyport Lagoon 08/31/09 and 09/01/09
CVAF analysis dates (Hg)	09/05/09, 09/08/09, 09/10/09, 09/11/09, 09/14/09, 09/15/09
Fe/Pd Preconcentration Dates for Seawater (Ag, Al, Cd, Cr, Cu, Pb, Zn)	09/13/09, 09/14/09, 09/28/09, 10/05/09
FIAS analysis dates (As)	09/20/09, 09/21/09
Equipment Blank TRM Prep and ICP-MS analysis date (Ag, Cd, Cr, Cu, Pb, Zn)	09/25/09
ICP-MS Seawater analysis dates (Ag, Al, As, Cd, Cr, Cu, Pb, Zn)	09/16/09, 09/22/09, 09/29/09, 10/08/09

Mercury	CVAF	70-130%	≤20%	≤30%	0.0001	0.00032

METHODS:

Seawater samples were analyzed for nine metals: aluminum (Al), arsenic (As), cadmium (Cd), chromium (Cr), copper (Cu), lead (Pb), silver (Ag), zinc (Zn), and mercury (Hg). Samples were submitted for analyses following two methods. All samples were analyzed for Hg by Cold Vapor Atomic Fluorescence (CVAF) in accordance with Battelle SOP *MSL-I-013*, *Total Mercury in Aqueous Samples by CVAF*, following EPA Method 1631 revision E.

Prior to analyses of all other metals, seawater samples were preconcentrated in accordance with Battelle SOP *MSL-I-025, Methods of Sample Preconcentration: Iron and Palladium/APDC Coprecipitation and Borohydride Reductive Precipitation for Trace Metals Analysis in Water*. Preconcentrated seawater samples were analyzed for Al (total only), Ag, Cd, Cr, Cu, Pb and Zn by Inductively Coupled Plasma-Mass Spectrometry (ICP-MS) in accordance with Battelle SOP *MSL-I-022, Determination of Elements in Aqueous and Digestate Samples by ICP/MS.* The base methods for this procedure are EPA Method 1638 and EPA Method 1640. All samples were analyzed for As by Flow-Injection Atomic Spectroscopy (FIAS) in accordance with Battelle SOP *MSL-I-030, Determination of Metals in Aqueous and Digestate Samples by Hydride Generation Atomic Absorption (HGAA) with Flow Injection (FIAS).* The base method for this procedure is EPA Method 270.3.

All results were reported in units of µg/L. Seawater data are reported as blank corrected for the metals requiring Fe/Pd preconcentration (Ag, Cd, Cr, Cu, Ni, Pb, and Zn) and qualified with a b-flag. The required preconcentration procedure for low level seawater samples includes the addition of chelating agents to induce precipitation of metals under specific conditions. Subsequently, reagents added to the samples should be of the purest quality to result in zero addition of metals to the seawater samples. All reagents have trace impurities of metals; therefore, the data are provided as blank corrected for these elements. Results were corrected using the BMRB_AMB01, or report batch mean reagent blank, noted on the QC table.

Equipment blank samples consist of deionized water collected in the Teflon sample bottles and filtered along with the AMB01 samples to generate both total metal (TME) equipment blanks and dissolved (DME) equipment blanks. The equipment blank samples were analyzed by Hg by CVAF as described above for the seawater. The freshwater matrix of equipment blanks does not require a preconcentration preparation prior to analysis for all other metals by ICP-MS. The preparation method for equipment blank is a total recoverable metals (TRM) method described in EPA Method 1640 followed by analyses by ICP-MS as described above.

QA/QC NARRATIVE

HOLDING TIMES: All samples were analyzed within the established holding times of 90 days for Hg and six months for all other metals.

DETECTION LIMITS: Laboratory method detection limits (MDLs) are reported from the 2009 Seawater MDL Study as determined by seven replicates of Sequim Bay Seawater spiked at an appropriate concentration for each analyte. The freshwater MDL was reported from the 2009 Freshwater MDL Study determined using seven replicates of deionized water prepared using the TRM preparation. Reporting limits are determined as 3.18 times the laboratory achieved MDL. The data are evaluated and flagged as follows:

U Analyte not detected at or above the MDL, MDL reported

J Analyte detected above the MDL, but less than the RL

N Spiked sample recovery outside QC criterion of 70-130%

& Accuracy result outside QC criterion of ≤20% PD

* Precision result outside QC criterion of <30%

B Analyte detected in the method blank > RL and sample concentration < 10 times detected blank value

c Exceeds data quality objective but meets contingency criterion

b Result is reagent blank corrected using the batch specific blank (BMRB)

METHOD BLANKS: For the seawater preparation and analyses, a minimum of three method blanks were analyzed by each instrument for each analytical batch. The average of all method blanks (n=24) was less than the RL for all metals except Zn. Sample concentrations were flagged with a "B" if the sample concentration was less than 10 times the detected blank. The required preconcentration procedure for low level seawater samples includes the addition of chelating agents to induce precipitation of metals under specific conditions. Subsequently, reagents added to the samples should be of the purest quality to result in zero addition of metals to the samples. The current reagents available contain traces of the metals of interest; therefore the data are blank corrected and qualified with a "b" to indicate a reagent blank corrected value.

LABORATORY CONTROL SAMPLES: A minimum of one LCS (OPR or blank spike) was prepared and analyzed with each analytical batch of 20 or fewer samples. Percent recoveries for LCS samples were within the QC acceptance criterion of 70% to 130% for all metals.

MATRIX SPIKE ACCURACY: A minimum of one set of matrix spike/matrix spike duplicate (MS/MSD) samples was prepared and analyzed with each analytical batch of 20 or fewer samples. Percent recoveries for MS/MSD pairs were within the QC limits of 70% to 130%. However, sample 3060*53 (unfiltered sample from M3.1) was outside the QC limits for Cd, Cr, Pb, and Zn. The sample contained high quantities of phytoplankton that interfered with the matrix spikes for these metals. A second matrix spike was prepared for both the total and dissolved sample collected from M3.1. The interference was reproducible for the unfiltered (total) sample and within the QC criterion for the dissolved. Acceptable analytical accuracy was demonstrated in all other matrix spikes.

REPLICATE PRECISION: Laboratory precision was expressed as the relative percent difference (RPD) between laboratory duplicates and replicate spike samples (MS/MSD). The RPD values for the laboratory duplicates were within the QC acceptance criterion of ±30% for all metals detected above the RL. Precision between the matrix spike pairs was reported as the

RPD between the pair of matrix spike recoveries. The RPD values were within the QC acceptance criterion of ±30% except one MS/MSD pair for Cr (36%).

STANDARD REFERENCE MATERIAL ACCURACY:

Standard reference materials were prepared and analyzed with each analytical batch at a minimum frequency of 1 per 20 or fewer samples. Analytical accuracy was expressed as the relative percent difference (PD) of the measured to certified concentration. The SRM for Hg was 1641d, a freshwater SRM as no seawater SRM was available. The percent differences were within the QC acceptance criterion of ≤20%.

One replicate of the freshwater SRM 1640 demonstrated analytical accuracy for each batch analyzed by ICP-MS. Percent differences were within the QC acceptance criterion of ± 20% for all metals.

Three seawater SRMs were prepared with each batch of preconcentrated samples prepared for analysis by ICP-MS. The SRMs were CASS-4, SLEW-3, and SLEW-2 and only metals certified greater than 10 times the MDL were used to evaluate data set accuracy. The percent differences for the seven replicates of CASS-4 were within the QC acceptance criterion with the exception of two replicates for Cd (21% and 27%) and three replicates for Zn (99%, 25%, and 37%). The percent differences for SLEW-3 were within the QC criterion for all metals certified greater than 10 times the MDL. The percent differences for SLEW-2 were within the QC criterion for all metals certified greater than 10 times the MDL except one replicate for Cd (25%), Pb (21%) and Zn (21%).

CONTINUING CALIBRATION VERIFICATION (CCV) ACCURACY:

The CCV samples were analyzed every 10 field samples. All CCVs were within the QC criterion of 85% to 115% recovery.

CASE NARRATIVE

All analyses were performed consistent with the quality assurance program of Columbia Analytical Services, Inc. (CAS). This report contains analytical results for samples designated for Tier III validation deliverables including summary forms and all of the associated raw data for each of the analyses. When appropriate to the method, method blank results have been reported with each analytical test.

Sample Receipt

Water samples were received for analysis at Columbia Analytical Services on 9/2/09. The samples were received in good condition and consistent with the accompanying chain of custody with some exception. The exceptions were resolved, as noted on the attached Cooler Receipt and Preservation Form and associated e-mail correspondence between CAS/Kelso and Battelle MSL. The samples were stored in a refrigerator at 4°C upon receipt at the laboratory.

General Comments

The results are reported to the CAS/Kelso Method Detection Limit (MDL), which is supported by MDL studies performed annually. The MDL studies are conducted according to 40 CFR Part 136, Appendix B.

General Chemistry Parameters

Ammonia by 350.1LL:
The Relative Percent Difference (RPD) criterion for the replicate analysis of Ammonia in sample M3.1 Deep was not applicable because the analyte concentration was not significantly greater than the Method Reporting Limit (MRL). Analytical values derived from measurements close to the detection limit are not subject to the same accuracy and precision criteria as results derived from measurements higher on the calibration range for the method.

Total Suspended Solids by Standard Method 2540D:
The Relative Percent Difference (RPD) criterion for the replicate analysis of Total Suspended Solids in samples PS11 and PS08 was not applicable because the analyte concentration was not significantly greater than the Method Reporting Limit (MRL). Analytical values derived from measurements close to the detection limit are not subject to the same accuracy and precision criteria as results derived from measurements higher on the calibration range for the method.

No other anomalies associated with the analysis of these samples were observed.

Hexane Extractable Material (HEM) by EPA Method 1664

Sample Notes and Discussion:
Insufficient sample volume was received to perform a Matrix Spike/Matrix Spike Duplicate (MS/MSD). A Laboratory Control Sample/Duplicate Laboratory Control Sample (LCS/DLCS) was analyzed in lieu of the MS/MSD for these samples.

No other anomalies associated with the analysis of these samples were observed.

Approved by _____ **Date** 9/24/09

Columbia Analytical Services, Inc.
Cooler Receipt and Preservation Form

Client / Project: Battelle Service Request K09 08111

Received: 9/2/09 Opened: 9/2/09 By: af

1. Samples were received via? *US Mail* (*Fed Ex*) *UPS* *DHL* *GH* *GS* *PDX* *Courier* *Hand Delivered*
2. Samples were received in: (circle) (*Cooler*) *Box* *Envelope* *Other* _____ *NA*
3. Were custody seals on coolers? NA Y (N) If yes, how many and where? _____
   If present, were custody seals intact? Y N If present, were they signed and dated? Y N
4. Is shipper's air-bill filed? If not, record air-bill number: _____ NA (Y) N

5. **Temperature of cooler(s) upon receipt (°C):** 1.4 3.0 2.9 1.1
   Temperature Blank (°C): 2.8 2.6 5.3 5.7
   Thermometer ID: 258 246 264 275
6. If applicable, list Chain of Custody Numbers:
7. Packing material used. *Inserts* *Baggies* (*Bubble Wrap*) (*Gel Packs*) *Wet Ice* *Sleeves* *Other* hardware pks
8. Were custody papers properly filled out (ink, signed, etc.)? NA (Y) N
9. **Did all bottles arrive in good condition (unbroken)?** *Indicate in the table below.* NA (Y) N
10. Were all sample labels complete (i.e analysis, preservation, etc.)? NA (Y) N
11. Did all sample labels and tags agree with custody papers? *Indicate in the table below* NA Y (N)
12. **Were appropriate bottles/containers and volumes received for the tests indicated?** NA (Y) N
13. Were the pH-preserved bottles tested* received at the appropriate pH? *Indicate in the table below* NA Y (N)
14. Were VOA vials received without headspace? *Indicate in the table below.* (NA) Y N
15. **Are CWA Microbiology samples received with >1/2 the 24hr. hold time remaining from collection?** (NA) Y N
16. Was C12/Res negative? (NA) Y N

Sample ID on Bottle	Sample ID on COC	Sample ID on Bottle	Sample ID on COC
MS.1 D	MS.1 Deep		

Sample ID	Bottle Count Bottle Type	Out of Temp	Head-space	Broke	pH	Reagent	Volume added	Reagent Lot Number	Initials	Time
PS15 (nutrient)	1-500y				✓	H2SO4	1ml	EM047851	af	1130

*Does not include all pH preserved sample aliquots received. See sample receiving SOP (SMO-GEN).

Additional Notes, Discrepancies, & Resolutions: ① Need nutrient, DOC, TSS bottles for PS09 not listed on COC. ② Did not rec. nutrient bottle for MRES18. ③ Rec'd 4 samples not on COC: PS04, PS05, PS06, PS07-1L w(TSS), 1-500y(nutrients), 1-500y(DOC) ④ PS02 nut + PS16 nut. PS15 TSS + PS15 DOC duplicated on COC.

COLUMBIA ANALYTICAL SERVICES, INC.

Client:	Battelle Marine Sciences Laboratory	**Service Request No.:**	K0908264
Project:	2009 Ambient Monitoring	**Date Received:**	9/4/09
Sample Matrix:	Water		

CASE NARRATIVE

All analyses were performed consistent with the quality assurance program of Columbia Analytical Services, Inc. (CAS). This report contains analytical results for samples designated for Tier III validation deliverables including summary forms and all of the associated raw data for each of the analyses. When appropriate to the method, method blank results have been reported with each analytical test.

Sample Receipt

Water samples were received for analysis at Columbia Analytical Services on 9/4/09. The samples were received in good condition and consistent with the accompanying chain of custody. The samples were stored in a refrigerator at 4°C upon receipt at the laboratory.

General Comments

The results are reported to the CAS/Kelso Method Detection Limit (MDL), which is supported by MDL studies performed annually. The MDL studies are conducted according to 40 CFR Part 136, Appendix B.

General Chemistry Parameters

Total Suspended Solids by Standard Method 2540D:
The Relative Percent Difference (RPD) criterion for the replicate analysis of Total Suspended Solids in samples M1 DEEP and M4 was not applicable because the analyte concentration was not significantly greater than the Method Reporting Limit (MRL). Analytical values derived from measurements close to the detection limit are not subject to the same accuracy and precision criteria as results derived from measurements higher on the calibration range for the method.

No other anomalies associated with the analysis of these samples were observed.

Cooler Receipt and Preservation Form

PC JCh -

Client / Project: Battelle Service Request K09 08264

Received: 9-4-09 Opened: 9-4-09 By: DW

1. Samples were received via? *US Mail* *Fed Ex* *UPS* *DHL* *GH* *GS* *PDX* *Courier* *Hand Delivered*
2. Samples were received in: (circle) *Cooler* *Box* *Envelope* *Other* _____ *NA*
3. Were custody seals on coolers? NA (Y) N If yes, how many and where? 1 front
   If present, were custody seals intact? (Y) N If present, were they signed and dated? (Y) N
4. Is shipper's air-bill filed? If not, record air-bill number: _____ NA (Y) N

5. **Temperature of cooler(s) upon receipt (°C):**	-0.6	1.0	1.8	1.2
Temperature Blank (°C):	2.4	2.5	2.1	2.2
Thermometer ID:	235	244	249	275
6. If applicable, list Chain of Custody Numbers:				

7. Packing material used. *Inserts* *Baggies* *Bubble Wrap* *Gel Packs* *Wet Ice* *Sleeves* *Other* Hard ICE

8. Were custody papers properly filled out (ink, signed, etc.)?	NA	(Y)	N
9. **Did all bottles arrive in good condition (unbroken)?** *Indicate in the table below.*	NA	(Y)	N
10. Were all sample labels complete (i.e analysis, preservation, etc.)?	NA	(Y)	N
11. Did all sample labels and tags agree with custody papers? *Indicate in the table below*	NA	Y	(N)
12. **Were appropriate bottles/containers and volumes received for the tests indicated?**	NA	(Y)	N
13. Were the pH-preserved bottles tested* received at the appropriate pH? *Indicate in the table below*	NA	(Y)	N
14. Were VOA vials received without headspace? *Indicate in the table below.*	(NA)	Y	N
15. **Are CWA Microbiology samples received with >1/2 the 24hr. hold time remaining from collection?**	(NA)	Y	N
16. Was C12/Res negative?	(NA)	Y	N

Metals in Water

DATA QUALIFIERS:

c	Exceeds DQO but meets contingency criteria of either:
1	SRM certified <10x MDL
2	Insufficient spiking level relative to native sample concentrations
3	Sample concentration <10x MDL
U	Analyte not detected at or above the MDL, MDL reported
J	Analyte detected above the MDL, but less than the RL
--	Not analyzed
NA	Not applicable/available
N	Spiked sample recovery outside QC criterion of 70-130%
NC	Not Certified
&	Accuracy result outside QC criterion of ≤20% PD
*	Precision result outside QC criterion of <30%
NS	Sample not spiked for this analyte
B	Analyte detected in the method blank > RL and sample concentration < 10 times detected blank value
b	Data are blank corrected using the batch specific procedural blank

QA/QC NARRATIVE

PROJECT: Sinclair and Dyes Inlet Ambient Monitoring, February 2010 (AMB002)

PARAMETER: Total and Dissolved Metals – Al (Total only), Ag, As (Total only), Cd, Cr, Cu, Pb, Zn, Hg

LABORATORY: Battelle Marine Sciences Laboratory (MSL), Sequim, Washington

MATRIX: Seawater and Equipment Blanks

SAMPLE CUSTODY AND PROCESSING: Samples were collected from Sinclair and Dyes Inlet region by MSL and the U.S. Navy on 02/02/10 and 02/03/10. Samples were hand delivered the day of collection to MSL by the field team. All samples were received in good condition. Samples were assigned a Battelle Central File (CF) identification number (3106) and were entered into Battelle's sample tracking system. Upon receipt at MSL, the sample designated for total and dissolved metals (TME/DME) were shaken vigorously and approximately 500mL was filtered through a pre-cleaned 0.45µm polyvinylidene fluoride (PVDF) filter membrane inside a class 100 clean bench and the filtrate was transferred to a trace metal clean Teflon bottle. The dissolved and total fractions were each acidified to a pH of < 2.0 with double distilled nitric acid.

The following lists information on sample receipt and processing activities:

Sample Receipt Dates:	02/02/2010 and 02/03/2010
Cooler temp. on arrival	All coolers were at 4.0±2°C
Collection dates	02/02/2010 and 02/03/2010, plus additional equipment blanks 03/17/2010
CVAF analysis dates (Hg)	02/19/10, 02/23/10, 02/24/10, 03/04/10, 03/05/10
Fe/Pd Preconcentration Dates (Ag, Al, Cd, Cr, Cu, Pb, Zn)	02/10/10, 02/11/10, 02/16/10, 02/17/10
FIAS analysis date (As)	02/19/10
ICP-MS analysis dates (Ag, Al, As, Cd, Cr, Cu, Pb, Zn)	02/11/10, 02/16/10, 02/17/10, 02/18/10, 02/19/10, 03/18/10

QA/QC DATA QUALITY OBJECTIVES FOR SEAWATER SAMPLES:

Analyte	Analytical Method for Seawater	MS Range of Recovery	SRM Percent Difference	Replicate Precision	Method Detection Limits (µg/L)	Reporting Limits (µg/L)

Mercury	CVAF	70-130%	≤20%	≤30%	0.0001	0.00032

METHODS:

Seawater samples were analyzed for nine metals: aluminum (Al), arsenic (As), cadmium (Cd), chromium (Cr), copper (Cu), lead (Pb), silver (Ag), zinc (Zn), and mercury (Hg). Samples were submitted for analyses following three methods. The following two methods do not require a salt removal technique prior to analyses, therefore, the data are not reported as reagent blank corrected for these elements. All samples were analyzed for Hg by Cold Vapor Atomic Fluorescence (CVAF) in accordance with Battelle SOP *MSL-I-013*, *Total Mercury in Aqueous Samples by CVAF*, following EPA Method 1631 revision E. The samples for total metals (TME) were analyzed for As by Flow-Injection Atomic Spectroscopy (FIAS) in accordance with Battelle SOP *MSL-I-030, Determination of Metals in Aqueous and Digestate Samples by Hydride Generation Atomic Absorption (HGAA) with Flow Injection (FIAS).* The base method for this procedure is EPA Method 270.3.

Prior to analyses of all other metals, seawater samples were preconcentrated via a precipitation step followed by reconstituted in a salt free solution in accordance with Battelle SOP *MSL-I-025, Methods of Sample Preconcentration: Iron and Palladium/APDC Coprecipitation and Borohydride Reductive Precipitation for Trace Metals Analysis in Water.* Preconcentrated seawater samples were analyzed for Al (total only), Ag, Cd, Cr, Cu, Pb and Zn by Inductively Coupled Plasma-Mass Spectrometry (ICP-MS) in accordance with Battelle SOP *MSL-I-022, Determination of Elements in Aqueous and Digestate Samples by ICP/MS.* The base methods for this procedure are EPA Method 1638 and EPA Method 1640. Freshwater samples such as equipment blanks were digested using the total metal recoverable (TRM) method established in EPA Method 1640 and in MSL SOP-I-022.

All results were reported in units of µg/L. Data are reported as both uncorrected and blank corrected for the metals requiring Fe/Pd preconcentration (Al, Ag, Cd, Cr, Cu, Ni, Pb, and Zn). The required preconcentration procedure for ICP-MS analyses includes the addition of chelating agents to induce precipitation of metals under specific conditions. Subsequently, reagents added to the samples should be of the purest quality to result in zero addition of metals to the seawater samples. All reagents have trace impurities of these metals; therefore, the data should be blank corrected for these elements. This is discussed in more detail below.

Equipment blank samples consist of deionized water collected in the Teflon sample bottles and filtered along with the AMB01 samples to generate both total metal (TME) equipment blanks and dissolved (DME) equipment blanks. The equipment blank samples were analyzed by Hg by CVAF as described above for the seawater. The

freshwater matrix of equipment blanks does not require a preconcentration preparation prior to analysis for all other metals by ICP-MS. The preparation method for equipment blank is a total recoverable metals (TRM) method described in EPA Method 1640 followed by analyses by ICP-MS as described above.

HOLDING TIMES: All samples were analyzed within the established holding times of 90 days for Hg and six months for all other metals.

DETECTION LIMITS: Laboratory method detection limits (MDLs) are reported from the 2009 Seawater MDL Study as determined by seven replicates of Sequim Bay Seawater spiked at an appropriate concentration for each analyte. The freshwater MDL was reported from the 2009 Freshwater MDL Study determined using seven replicates of deionized water prepared using the TRM preparation. Reporting limits are determined as 3.18 times the laboratory achieved MDL. The data are evaluated and flagged as follows:

U Analyte not detected at or above the MDL, MDL reported

J Analyte detected above the MDL, but less than the RL

N Spiked sample recovery outside QC criterion of 70-130%

& Accuracy result outside QC criterion of ≤20% PD

* Precision result outside QC criterion of <30%

B Analyte detected in the method blank > RL and sample concentration < 10 times detected blank value

c Exceeds data quality objective but meets contingency criterion

b Result is reagent blank corrected using the batch specific blank (BMRB)

METHOD BLANKS: A minimum of three method blanks were analyzed by each instrument and each analytical batch. The average of all method blanks (n=15) was less than the RL for all metals except Zn. Sample concentrations were all greater than 10 times the detected blank.

Analytical note on the detected blanks in preconcentrated seawater. The required preconcentration procedure to remove salt interferences prior to ICP-MS analysis includes the addition of chelating agents to induce precipitation of metals under specific conditions. Subsequently, reagents added to the samples should be of the purest quality to result in zero addition of metals to the samples. The current reagents available contain traces of the metals of interest; therefore the data should be blank corrected. The average of the 15 reagent blanks prepared with these samples was used to reagent blank correct the data.

LABORATORY CONTROL SAMPLES: A minimum of one LCS (OPR or blank spike) was prepared and analyzed with each analytical batch of 20 or fewer samples. Percent recoveries for LCS samples were within the QC acceptance criterion of 70% to 130% for all metals except one replicate for Al. The LCS matrix used for Al, Ag, Cd, Cr, Cu, Ni, Pb, and Zn is Sequim Bay Seawater carried through the preconcentration and analytical process. The unspiked concentration of Al in Sequim Bay Seawater was 3.53µg/L and the spike was 2.0µg/L. The LCS was underspiked for Al and flagged with a "c".

QA/QC NARRATIVE

MATRIX SPIKE ACCURACY:

A minimum of one set of matrix spike/matrix spike duplicate (MS/MSD) samples was prepared and analyzed with each analytical batch of 20 or fewer samples. Percent recoveries for MS/MSD pairs were within the QC limits of 70% to 130%.

REPLICATE PRECISION:

Laboratory precision was expressed as the relative percent difference (RPD) between laboratory duplicates. The RPD values for the laboratory duplicates were within the QC acceptance criterion of ±30% for all metals detected above the RL.

STANDARD REFERENCE MATERIAL ACCURACY:

Standard reference materials (SRM) were prepared and analyzed with each analytical batch at a minimum frequency of 1 per 20 or fewer samples. Analytical accuracy was expressed as the percent recovery of the measured value relative to the certified concentration. The SRM for Hg was 1641d, a freshwater SRM as no seawater SRM was available. The percent recoveries were within the QC acceptance criterion of 80-120%. The SRM for As was a coastal ocean CASS-4 SRM. The percent recoveries were within the QC acceptance criterion. Two different SRMs were analyzed with the analytical batches for Al, Ag, Cd, Cr, Cu, Ni, Pb, and Zn quantified by ICP-MS.

The freshwater SRM 1640 demonstrated analytical accuracy for each batch analyzed by ICP-MS and the freshwater sample matrices (e.g. equipment blanks). Percent recoveries were within the QC acceptance criterion.

Two seawater SRMs were prepared with each batch of preconcentrated samples prepared for analysis by ICP-MS. The SRMs were CASS-5 and SLEW-2. The Cr and Pb concentrations in CASS-5 are certified less than 10 times the MDL and were not used to evaluate data set accuracy. In addition, Cr in SLEW-2 was also certified less than 10 times the MDL. The percent recoveries for these metals were flagged with a "c" indicating they meet the contingency criterion. The data are presented as both uncorrected and reagent blank corrected. The reagent blank corrected data were used to assess the accuracy of the analytical batch. The SRM CASS-5 is not certified for Ag or Al. High purity standards and the freshwater SRM were used to evaluate analytical accuracy. The percent recoveries for CASS-5 were within the QC acceptance criterion with the exception of Cd (127%, 121%, 124%, and 124%), one Cu (123%), and three replicates for Zn (76%, 73%, and 69%). The percent recoveries for SLEW-2 were within the QC criterion for all metals except two replicates for Pb (128%, 79%) and one for Zn (124%). The exceptions were generally within the criterion of 70-130%.

CONTINUING CALIBRATION VERIFICATION (CCV) ACCURACY:

The CCV samples were analyzed every 10 field samples. All CCVs were within the QC criterion of 85% to 115% recovery.

Project:	ENVVEST Feb. 2010 Ambient Monitoring	**Date Received:**	2/4/10
Sample Matrix:	Water		

CASE NARRATIVE

All analyses were performed consistent with the quality assurance program of Columbia Analytical Services, Inc. (CAS). This report contains analytical results for samples designated for Tier III validation deliverables including summary forms and all of the associated raw data for each of the analyses. When appropriate to the method, method blank results have been reported with each analytical test.

Sample Receipt

Aqueous samples were received for analysis at Columbia Analytical Services on 2/4/10. The samples were received in good condition and consistent with the accompanying chain of custody. The samples were stored in a refrigerator at 4°C upon receipt at the laboratory.

General Comments

The results were reported to the CAS/Kelso Method Detection Limit (MDL), which is supported by MDL studies performed annually. The MDL studies were conducted according to 40 CFR Part 136, Appendix B.

Total Solids (TS) by SM 2540B

No anomalies associated with the analysis of these samples were observed.

Total Suspended Solids by SM 2540D

No anomalies associated with the analysis of these samples were observed.

Nitrate + Nitrite by EPA Method 353.2

No anomalies associated with the analysis of these samples were observed.

Ammonia as Nitrogen by EPA Method 350.1

No anomalies associated with the analysis of these samples were observed.

Total Organic Carbon (TOC) and Dissolved Organic Carbon (DOC) by SM 5310C

The DOC was higher than the associated TOC for the majority of samples. Inspection of all raw data, sequences, and associated QA/QC measurements indicated the elevated DOC was probably a result of contribution during the field filtration procedure.

No other anomalies associated with the analysis of these samples were observed.

Approved by _____ **Date** 3/1/10

Total Phosphorus by EPA Method 365.3

No anomalies associated with the analysis of these samples were observed.

Total Kjeldahl Nitrogen by EPA Method 351.4

No anomalies associated with the analysis of these samples were observed.

Hexane Extractable Material by EPA Method 1664

No anomalies associated with the analysis of these samples were observed.

Approved by _____ **Date** 3/1/10

Columbia Analytical Services, Inc.
Cooler Receipt and Preservation Form

PC JC

Client / Project: Battelle Service Request K1001019

Received: 2/4/10 Opened: 2/4/10 By: AJ

1. Samples were received via? *Mail* (*Fed Ex*) *UPS* *DHL* *PDX* *Courier* *Hand Delivered*
2. Samples were received in: (circle) (*Cooler*) *Box* *Envelope* *Other* _____ *NA*
3. Were custody seals on coolers? NA Y (N) If yes, how many and where? _____
   If present, were custody seals intact? Y N If present, were they signed and dated? Y N

Cooler Temp °C	Temp Blank °C	Thermometer ID	Cooler/COC ID (NA)	Tracking Number NA	Filed
1.4	na	284	↓		X
0.3	na	268			X
1.4	na	282			X
1.2	2.2	258			X

7. Packing material used. *Inserts* *Baggies* *Bubble Wrap* (*Gel Packs*) *Wet Ice* (*Sleeves*) *Other* hard ice pks
8. Were custody papers properly filled out (ink, signed, etc.)? NA (Y) N
9. Did all bottles arrive in good condition (unbroken)? *Indicate in the table below.* NA (Y) N
10. Were all sample labels complete (i.e analysis, preservation, etc.)? NA (Y) N
11. Did all sample labels and tags agree with custody papers? *Indicate major discrepancies in the table on page 2.* NA (Y) N
12. Were appropriate bottles/containers and volumes received for the tests indicated? NA (Y) N
13. Were the pH-preserved bottles (*see SMO GEN SOP*) received at the appropriate pH? *Indicate in the table below* NA (Y) N
14. Were VOA vials received without headspace? *Indicate in the table below.* (NA) Y N
15. Was C12/Res negative? (NA) Y N

Notes, Discrepancies, & Resolutions: _____

COLUMBIA ANALYTICAL SERVICES, INC.

Client:	Battelle Marine Sciences Laboratory	**Service Request No.:**	K1001101
Project:	ENVVEST Feb. 2010 Ambient Monitoring	**Date Received:**	2/5/10
Sample Matrix:	Water		

CASE NARRATIVE

All analyses were performed consistent with the quality assurance program of Columbia Analytical Services, Inc. (CAS). This report contains analytical results for samples designated for Tier III validation deliverables including summary forms and all of the associated raw data for each of the analyses. When appropriate to the method, method blank results have been reported with each analytical test.

Sample Receipt

Aqueous samples were received for analysis at Columbia Analytical Services on 2/5/10. The samples were received in good condition and consistent with the accompanying chain of custody. The samples were stored in a refrigerator at 4°C upon receipt at the laboratory.

General Comments

The results were reported to the CAS/Kelso Method Detection Limit (MDL), which is supported by MDL studies performed annually. The MDL studies were conducted according to 40 CFR Part 136, Appendix B.

Total Solids (TS) by SM 2540B

No anomalies associated with the analysis of these samples were observed.

Total Suspended Solids by SM 2540D

No anomalies associated with the analysis of these samples were observed.

Nitrate + Nitrite by EPA Method 353.2

No anomalies associated with the analysis of these samples were observed.

Ammonia as Nitrogen by EPA Method 350.1

No anomalies associated with the analysis of these samples were observed.

Total Organic Carbon (TOC) and Dissolved Organic Carbon (DOC) by SM 5310C

The DOC was higher than the associated TOC for a number of samples. Inspection of all raw data, sequences, and associated QA/QC measurements indicated the elevated DOC was probably a result of contribution during the field filtration procedure.

No other anomalies associated with the analysis of these samples were observed.

Approved by _____ **Date** 3/3/10

Total Phosphorus by EPA Method 365.3

No anomalies associated with the analysis of these samples were observed.

Total Kjeldahl Nitrogen by EPA Method 351.4

No anomalies associated with the analysis of these samples were observed.

Hexane Extractable Material by EPA Method 1664

No anomalies associated with the analysis of these samples were observed.

Approved by _____ **Date** 3/3/10

Columbia Analytical Services, Inc.
Cooler Receipt and Preservation Form

PC JCH-

Client / Project: Battelle Service Request K10 01101

Received: 2/5/10 Opened: 2/5/10 By: Jomar

1. Samples were received via? *Mail* (*Fed Ex*) *UPS* *DHL* *PDX* *Courier* *Hand Delivered*
2. Samples were received in: (circle) (*Cooler*) *Box* *Envelope* *Other* _____ *NA*
3. Were custody seals on coolers? NA Y (N) If yes, how many and where? _____
   If present, were custody seals intact? Y N If present, were they signed and dated? Y N

Cooler Temp °C	Temp Blank °C	Thermometer ID	Cooler/COC ID (NA)	Tracking Number NA	(Filed)
3.7	/	266			
1.0	/	275			
1.7		279			

7. Packing material used. *Inserts* *Baggies* *Bubble Wrap* (*Gel Packs*) *Wet Ice* *Sleeves* (*Other* Blue ice)
8. Were custody papers properly filled out (ink, signed, etc.)? NA (Y) N
9. Did all bottles arrive in good condition (unbroken)? *Indicate in the table below.* NA (Y) N
10. Were all sample labels complete (i.e analysis, preservation, etc.)? NA (Y) N
11. Did all sample labels and tags agree with custody papers? *Indicate major discrepancies in the table on page 2.* NA (Y) N
12. Were appropriate bottles/containers and volumes received for the tests indicated? NA (Y) N
13. Were the pH-preserved bottles (*see SMO GEN SOP*) received at the appropriate pH? *Indicate in the table below* NA (Y) N
14. Were VOA vials received without headspace? *Indicate in the table below.* (NA) Y N
15. Was C12/Res negative? (NA) Y N

Sample ID on Bottle	Sample ID on COC	Identified by:

Sample ID	Bottle Count Bottle Type	Out of Temp	Head-space	Broke	pH	Reagent	Volume added	Reagent Lot Number	Initials	Time

Notes, Discrepancies, & Resolutions: _____

ENVVEST 2010_AMB03
Metals in Water

DATA QUALIFIERS:

c	Exceeds DQO but meets contingency criteria of either:
1	SRM certified <10x MDL
2	Insufficient spiking level relative to native sample concentrations
3	Sample concentration <10x MDL
U	Analyte not detected at or above the MDL, MDL reported
J	Analyte detected above the MDL, but less than the RL
--	Not analyzed
NA	Not applicable/available
N	Spiked sample recovery outside QC criterion of 70-130%
NC	Not Certified
&	Accuracy result outside QC criterion of ≤20% PD
*	Precision result outside QC criterion of <30%
NS	Sample not spiked for this analyte
B	Analyte detected in the method blank > RL
	and sample concentration < 10 times detected blank value
b	Data are blank corrected using the batch specific procedural blank

QA/QC NARRATIVE

PROJECT: Sinclair and Dyes Inlet Ambient Monitoring, March 2010 (AMB003)

PARAMETER: Total and Dissolved Metals – Al (Total only), Ag, As (Total only), Cd, Cr, Cu, Pb, Zn, Hg

LABORATORY: Battelle Marine Sciences Laboratory (MSL), Sequim, Washington

MATRIX: Seawater and Equipment Blanks (DI water matrix)

SAMPLE CUSTODY AND PROCESSING: Samples were collected from Sinclair and Dyes Inlet region by MSL and the U.S. Navy on 03/23/10 and 03/24/10. Samples were hand delivered the day of collection to MSL by the field team. All samples were received in good condition. Samples were assigned a Battelle Central File (CF) identification number (3106) and were entered into Battelle's sample tracking system. Upon receipt at MSL, the samples designated for total and dissolved metals (TME/DME) were shaken vigorously and approximately 500mL was filtered through a pre-cleaned 0.45µm polyvinylidene fluoride (PVDF) filter membrane inside a class 100 clean bench and the filtrate was transferred to a trace metal clean Teflon bottle. The dissolved and total fractions were each acidified to a pH of < 2.0 with double distilled nitric acid.

The following lists information on sample receipt and processing activities:

Sample Receipt Dates:	03/23/2010 and 03/24/2010
Cooler temp. on arrival	All coolers were at 4.0±2°C
Collection dates	03/23/2010 and 03/24/2010
CVAF analysis dates (Hg)	04/27/10, 04/28/10, 05/03/10, 05/04/10, 05/06/10 and 05/10/10
TRM Prep Dates for Freshwater by ICP-MS (Ag, Al, Cd, Cr, Cu, Pb, Zn)	04/14/10
Fe/Pd Preconcentration Dates prior to ICP-MS Analysis (Ag, Al, Cd, Cr, Cu, Pb, Zn)	03/29/10, 03/30/10, 04/01/10, 04/05/10, and 04/13/10
FIAS analysis date (As)	04/26/10
ICP-MS analysis dates (Ag, Al, Cd, Cr, Cu, Pb, Zn)	03/30/10, 03/31/10, 04/02/10, 04/06/10, 04/14/10, and 04/15/10

QA/QC NARRATIVE

QA/QC DATA QUALITY OBJECTIVES FOR SEAWATER SAMPLES:

Mercury	CVAF	70-130%	≤20%	≤30%	0.0001	0.00032

METHODS:

Seawater samples were analyzed for nine metals: aluminum (Al), arsenic (As), cadmium (Cd), chromium (Cr), copper (Cu), lead (Pb), silver (Ag), zinc (Zn), and mercury (Hg). Samples were submitted for analyses following three methods. The analyses of As and Hg do not require a salt removal technique prior to analyses, therefore, the data are not reported as reagent blank corrected (identified as a "b" qualifier) for these elements. All samples were analyzed for Hg by Cold Vapor Atomic Fluorescence (CVAF) in accordance with Battelle SOP *MSL-I-013*, *Total Mercury in Aqueous Samples by CVAF*, following EPA Method 1631 revision E. The samples for total metals (TME) were analyzed for As by Flow-Injection Atomic Spectroscopy (FIAS) in accordance with Battelle SOP *MSL-I-030, Determination of Metals in Aqueous and Digestate Samples by Hydride Generation Atomic Absorption (HGAA) with Flow Injection (FIAS).* The base method for this procedure is EPA Method 270.3.

Prior to analyses of all other metals, seawater samples were preconcentrated via a precipitation step followed by reconstituted in a salt free solution in accordance with Battelle SOP *MSL-I-025, Methods of Sample Preconcentration: Iron and Palladium/APDC Coprecipitation and Borohydride Reductive Precipitation for Trace Metals Analysis in Water.* Preconcentrated seawater samples were analyzed for Al (total only), Ag, Cd, Cr, Cu, Pb and Zn by Inductively Coupled Plasma-Mass Spectrometry (ICP-MS) in accordance with Battelle SOP *MSL-I-022, Determination of*

QA/QC NARRATIVE

METHODS: *Elements in Aqueous and Digestate Samples by ICP/MS.* The base methods for this procedure are EPA Method 1638 and EPA Method 1640. Freshwater samples such as equipment blanks were digested using the total metal recoverable (TRM) method established in EPA Method 1640 prior to analysis by ICP-MS following SOP MSL-I-022.

All results were reported in units of µg/L. Data are reported as blank corrected for the metals requiring Fe/Pd preconcentration (Al, Ag, Cd, Cr, Cu, Ni, Pb, and Zn) and qualified with a b-flag. The required preconcentration procedure for ICP-MS analyses includes the addition of chelating agents to induce precipitation of metals under specific conditions. Subsequently, reagents added to the samples should be of the purest quality to result in zero addition of metals to the seawater samples. Required reagents have trace impurities of these metals; therefore, the data are blank corrected for these elements. Results were corrected using the mean batch reagent blank identified for each preparation batch as BMRB_analysis date and provided in the table identified as the QC Results for ICP-MS.

Equipment blank samples and field samples identified as < 5% seawater were analyzed as follows. Equipment blanks were created by MSL using the same lot of bottles and filter units cleaned for AMB03. They consist of deionized water collected in the Teflon sample bottle (1L) and filtered along with the AMB03 samples to generate both total metal (TME) equipment blanks and dissolved (DME) equipment blanks. The equipment blank samples were analyzed for Hg by CVAF as described above for the seawater. The freshwater matrix of equipment blanks does not require a preconcentration preparation prior to analysis for all other metals by ICP-MS. The preparation method for freshwater is a total recoverable metals (TRM) method described in EPA Method 1640 followed by analyses by ICP-MS as described above.

HOLDING TIMES: All samples were analyzed within the established holding times of 90 days for Hg and six months for all other metals.

DETECTION LIMITS: Laboratory method detection limits (MDLs) for seawater are reported from the Annual Seawater MDL Study as determined by seven replicates of Sequim Bay Seawater spiked at an appropriate concentration for each analyte. The freshwater MDL was reported from the Annual Freshwater MDL Study determined using seven replicates of deionized water prepared using the TRM preparation. Reporting limits are determined as 3.18 times the laboratory achieved MDL. The data are evaluated and flagged as follows:

U Analyte not detected at or above the MDL, MDL reported

J Analyte detected above the MDL, but less than the RL

N Spiked sample recovery outside QC criterion of 70-130%

& Accuracy result outside QC criterion of ≤20% PD

* Precision result outside QC criterion of <30%

B Analyte detected in the method blank > RL and sample concentration < 10 times detected blank value

c Exceeds data quality objective but meets contingency criterion

b Result is reagent blank corrected using the batch specific blank (BMRB)

QA/QC NARRATIVE

METHOD BLANKS: A minimum of three method blanks were analyzed by each instrument with each analytical batch. The average method blank for each batch was less than the RL for all metals except Cr and Zn. The required preconcentration procedure to remove salt interferences prior to ICP-MS analysis includes the addition of chelating agents to induce precipitation of metals under specific conditions as discussed in the method section. The data were evaluated and qualified with a "B" if the sample concentration was less than ten times the mean detected blank for the analytical batch.

LABORATORY CONTROL SAMPLES: A minimum of one LCS (OPR or blank spike) was prepared and analyzed with each analytical batch of 20 or fewer samples. Percent recoveries for LCS samples were within the QC acceptance criterion of 70% to 130% for all metals except Al. The LCS matrix used for Al, Ag, Cd, Cr, Cu, Ni, Pb, and Zn is Sequim Bay Seawater carried through the preconcentration and analytical process. The quantification of Al is not considered a critical chemical measurement; therefore, the spiking levels are optimized for the other metals of interest. The spiking level is less than the MDL and considered underspiked with respects to Al; results were reported and J-flagged when detected. The accuracy of Al was evaluated on matrix spikes, freshwater SRMs, and high purity standards.

MATRIX SPIKE ACCURACY: A minimum of one matrix spike or set of matrix spikes (MS/MSD) was prepared and analyzed with each analytical batch of 20 or fewer samples. Percent recoveries for matrix spikes were within the QC limits of 70% to 130% for all metals except one spike for Al (-14%). The spiked sample was less than the RL and qualified with a "c" as discussed above.

REPLICATE PRECISION: Laboratory precision was expressed as the relative percent difference (RPD) between laboratory duplicates. The RPD values for the laboratory duplicates were within the QC acceptance criterion of ±30% for all metals detected above the RL.

STANDARD REFERENCE MATERIAL ACCURACY: Standard reference materials (SRM) were prepared and analyzed with each analytical batch at a minimum frequency of 1 per 20 or fewer samples. Analytical accuracy was expressed as the percent difference (PD) between the measured and the certified value. The SRM for Hg was 1641d, a freshwater SRM as no seawater SRM was available. The percent recoveries were within the QC acceptance criterion of 80-120%. The SRM for As was the coastal ocean SRM CASS-4. The percent recoveries were within the QC acceptance criterion. Two different SRMs were analyzed with the analytical batches for Al, Ag, Cd, Cr, Cu, Ni, Pb, and Zn quantified by ICP-MS.

The freshwater SRM 1640 demonstrated analytical accuracy for each batch analyzed by ICP-MS and the freshwater sample matrices (e.g. equipment blanks and outfall 021). Percent recoveries were within the QC acceptance criterion.

The seawater SRM prepared with each batch of preconcentrated samples was CASS-5. The Cr and Pb concentrations in CASS-5 are certified less than 10 times the MDL and were only used to evaluate data set accuracy. The percent recoveries for these metals were flagged with a "c" indicating they meet the contingency criterion. The seawater SRMs are not certified for Ag or Al. High purity standards and the freshwater SRM were used to evaluate analytical accuracy for these metals. The percent recoveries for CASS-5 were within the QC acceptance criterion with the exception of two for Cd (25% and 26% PD) and one for Zn (24% PD). The exceptions were within the criterion of 70-130%.

Sample Matrix:	Water		

CASE NARRATIVE

All analyses were performed consistent with the quality assurance program of Columbia Analytical Services, Inc. (CAS). This report contains analytical results for samples designated for Tier III validation deliverables including summary forms and all of the associated raw data for each of the analyses. When appropriate to the method, method blank results have been reported with each analytical test.

Sample Receipt

Aqueous samples were received for analysis at Columbia Analytical Services on 3/25/10. The samples were received in good condition and consistent with the accompanying chain of custody. The samples were stored in a refrigerator at 4°C upon receipt at the laboratory.

General Comments

The results were reported to the CAS/Kelso Method Detection Limit (MDL), which is supported by MDL studies performed annually. The MDL studies were conducted according to 40 CFR Part 136, Appendix B.

Total Solids (TS) by SM 2540B

No anomalies associated with the analysis of these samples were observed.

Total Suspended Solids by SM 2540D

No anomalies associated with the analysis of these samples were observed.

Nitrate + Nitrite by EPA Method 353.2

No anomalies associated with the analysis of these samples were observed.

Ammonia as Nitrogen by EPA Method 350.1

No anomalies associated with the analysis of these samples were observed.

Total Organic Carbon (TOC) and Dissolved Organic Carbon (DOC) by SM 5310C

The DOC was higher than the associated TOC for a number of samples. Inspection of all raw data, sequences, and associated QA/QC measurements indicated the elevated DOC was probably a result of contribution during the field filtration procedure.

No other anomalies associated with the analysis of these samples were observed.

Approved by _____ **Date** 4/15/10

Total Phosphorus by EPA Method 365.3

No anomalies associated with the analysis of these samples were observed.

Total Kjeldahl Nitrogen by EPA Method 351.4

No anomalies associated with the analysis of these samples were observed.

Hexane Extractable Material by EPA Method 1664

No anomalies associated with the analysis of these samples were observed.

Approved by_____ **Date** 4/15/10

Project:	Mar 2020 Ambient Monitoring	**Date Received:**	3/26/10
Sample Matrix:	Water		

CASE NARRATIVE

All analyses were performed consistent with the quality assurance program of Columbia Analytical Services, Inc. (CAS). This report contains analytical results for samples designated for Tier III validation deliverables including summary forms and all of the associated raw data for each of the analyses. When appropriate to the method, method blank results have been reported with each analytical test.

Sample Receipt

Aqueous samples were received for analysis at Columbia Analytical Services on 3/26/10. The samples were received in good condition and consistent with the accompanying chain of custody. The samples were stored in a refrigerator at 4°C upon receipt at the laboratory.

General Comments

The results were reported to the CAS/Kelso Method Detection Limit (MDL), which is supported by MDL studies performed annually. The MDL studies were conducted according to 40 CFR Part 136, Appendix B.

Total Solids (TS) by SM 2540B

No anomalies associated with the analysis of these samples were observed.

Total Suspended Solids by SM 2540D

No anomalies associated with the analysis of these samples were observed.

Nitrate + Nitrite by EPA Method 353.2

No anomalies associated with the analysis of these samples were observed.

Ammonia as Nitrogen by EPA Method 350.1

No anomalies associated with the analysis of these samples were observed.

Total Organic Carbon (TOC) and Dissolved Organic Carbon (DOC) by SM 5310C

The DOC was higher than the associated TOC for the majority of samples. The bias was relatively small, except sample AMB03-373. Inspection of all raw data, sequences, and associated QA/QC measurements indicated the elevated DOC was probably a result of contribution during the field filtration procedure.

No other anomalies associated with the analysis of these samples were observed.

Approved by _____ **Date** 4/21/10

Total Phosphorus by EPA Method 365.3

No anomalies associated with the analysis of these samples were observed.

Total Kjeldahl Nitrogen by EPA Method 351.4

No anomalies associated with the analysis of these samples were observed.

Hexane Extractable Material by EPA Method 1664

No anomalies associated with the analysis of these samples were observed.

Approved by _____ **Date** 7/21/10

ENVVEST 2010_AMB04
Metals in Water

DATA QUALIFIERS:

c	Exceeds DQO but meets contingency criteria of either:
1	SRM certified <10x MDL
2	Insufficient spiking level relative to native sample concentrations
3	Sample concentration <10x MDL
U	Analyte not detected at or above the MDL, MDL reported
J	Analyte detected above the MDL, but less than the RL
--	Not analyzed
NA	Not applicable/available
N	Spiked sample recovery outside QC criterion of 70-130%
NC	Not Certified
&	Accuracy result outside QC criterion of ≤20% PD
*	Precision result outside QC criterion of <30%
NS	Sample not spiked for this analyte
B	Analyte detected in the method blank > RL
	and sample concentration < 10 times detected blank value
b	Data are blank corrected using the batch specific procedural blank

PROJECT: Sinclair and Dyes Inlet Ambient Monitoring, September 2010 (AMB004)

PARAMETER: Total and Dissolved Metals – Al (Total only), Ag, As (Total only), Cd, Cr, Cu, Pb, Zn, Hg

LABORATORY: Battelle Marine Sciences Laboratory (MSL), Sequim, Washington

MATRIX: Seawater and Equipment Blanks (DI water matrix)

SAMPLE CUSTODY AND PROCESSING: Samples were collected from Sinclair and Dyes Inlet region by MSL and the U.S. Navy on 09/08/10 and 09/09/10. Samples were hand delivered the day of collection to MSL by the field team. All samples were received in good condition. Samples were assigned a Battelle Central File (CF) identification number (3106) and were entered into Battelle's sample tracking system. Upon receipt at MSL, the samples designated for total and dissolved metals (TME/DME) were shaken vigorously and approximately 500mL was filtered through a pre-cleaned 0.45µm polyvinylidene fluoride (PVDF) filter membrane inside a class 100 clean bench and the filtrate was transferred to a trace metal clean Teflon bottle. The dissolved and total fractions were each acidified to a pH of < 2.0 with double distilled nitric acid.

The following lists information on sample receipt and processing activities:

Sample Receipt Dates:	09/08/10 and 09/09/10
Cooler temp. on arrival	All coolers were at 4.0±2°C
Collection dates	09/08/10 and 09/09/10
CVAF analysis dates (Hg)	09/21/10, 09/22/10, 09/23/10, 09/24/10, 09/27/10
TRM Prep/Freshwater Analysis by ICP-MS (Ag, Al, Cd, Cr, Cu, Pb, Zn)	09/14/10
Fe/Pd Preconcentration Seawater Analysis by ICP-MS (Ag, Al, Cd, Cr, Cu, Pb, Zn)	09/20/10, 09/22/10, 09/23/10, 09/30/10, 10/05/10
FIAS analysis date (As)	10/15/10

QA/QC DATA QUALITY OBJECTIVES FOR SEAWATER SAMPLES:

Mercury	CVAF	70-130%	≤20%	≤30%	0.0001	0.00032

METHODS:

Seawater samples were analyzed for nine metals: aluminum (Al), arsenic (As), cadmium (Cd), chromium (Cr), copper (Cu), lead (Pb), silver (Ag), zinc (Zn), and mercury (Hg). Samples were submitted for analyses following three methods. The analyses of As and Hg do not require a salt removal technique prior to analyses, therefore, the data are not reported as reagent blank corrected (identified as a "b" qualifier) for these elements. All samples were analyzed for Hg by Cold Vapor Atomic Fluorescence (CVAF) in accordance with Battelle SOP *MSL-I-013, Total Mercury in Aqueous Samples by CVAF*, following EPA Method 1631 revision E. The samples for total metals (TME) were analyzed for As by Flow-Injection Atomic Spectroscopy (FIAS) in accordance with Battelle SOP *MSL-I-030, Determination of Metals in Aqueous and Digestate Samples by Hydride Generation Atomic Absorption (HGAA) with Flow Injection (FIAS).* The base method for this procedure is EPA Method 270.3.

Prior to analyses of all other metals, seawater samples were preconcentrated via a precipitation step followed by reconstituted in a salt free solution in accordance with Battelle SOP *MSL-I-025, Methods of Sample Preconcentration: Iron and Palladium/APDC Coprecipitation and Borohydride Reductive Precipitation for Trace Metals Analysis in Water*. Preconcentrated seawater samples were analyzed for Al (total only), Ag, Cd, Cr, Cu, Pb and Zn by Inductively Coupled Plasma-Mass Spectrometry (ICP-MS) in accordance with Battelle SOP *MSL-I-022, Determination of*

METHODS: *Elements in Aqueous and Digestate Samples by ICP/MS.* The base methods for this procedure are EPA Method 1638 and EPA Method 1640. Freshwater samples such as equipment blanks were digested using the total metal recoverable (TRM) method established in EPA Method 1640 prior to analysis by ICP-MS following SOP MSL-I-022.

All results were reported in units of µg/L. Data are reported as blank corrected for the metals requiring Fe/Pd preconcentration (Al, Ag, Cd, Cr, Cu, Ni, Pb, and Zn) and qualified with a b-flag. The required preconcentration procedure for ICP-MS analyses includes the addition of chelating agents to induce precipitation of metals under specific conditions. Subsequently, reagents added to the samples should be of the purest quality to result in zero addition of metals to the seawater samples. Required reagents have trace impurities of these metals; therefore, the data are blank corrected for these elements. Results were corrected using the mean batch reagent blank identified for each preparation batch as BMRB_analysis date and provided in the table identified as the QC Results for ICP-MS.

Equipment blank samples and field samples identified as < 5% seawater were analyzed as follows. Equipment blanks were created by MSL using the same lot of bottles and filter units cleaned for AMB04. They consist of deionized water collected in the Teflon sample bottle (1L) and filtered along with the AMB04 samples to generate both total metal (TME) equipment blanks and dissolved (DME) equipment blanks. The equipment blank samples were analyzed for Hg by CVAF as described above for the seawater. The freshwater matrix of equipment blanks does not require a preconcentration preparation prior to analysis for all other metals by ICP-MS. The preparation method for freshwater is a total recoverable metals (TRM) method described in EPA Method 1640 followed by analyses by ICP-MS as described above.

HOLDING TIMES: All samples were analyzed within the established holding times of 90 days for Hg and six months for all other metals.

DETECTION LIMITS: Laboratory method detection limits (MDLs) for seawater are reported from the Annual Seawater MDL Study as determined by seven replicates of Sequim Bay Seawater spiked at an appropriate concentration for each analyte. The freshwater MDL was reported from the Annual Freshwater MDL Study determined using seven replicates of deionized water prepared using the TRM preparation. Reporting limits are determined as 3.18 times the laboratory achieved MDL. The data are evaluated and flagged as follows:

U Analyte not detected at or above the MDL, MDL reported

J Analyte detected above the MDL, but less than the RL

N Spiked sample recovery outside QC criterion of 70-130%

& Accuracy result outside QC criterion of ≤20% PD

* Precision result outside QC criterion of <30%

B Analyte detected in the method blank > RL and sample concentration < 10 times detected blank value

c Exceeds data quality objective but meets contingency criterion

b Result is reagent blank corrected using the batch specific blank (BMRB)

METHOD BLANKS: A minimum of three method blanks were analyzed by each instrument with each analytical batch. The average method blank for each batch was less than the RL for all metals except Cr and Zn. The required preconcentration procedure to remove salt interferences prior to ICP-MS analysis includes the addition of chelating agents to induce precipitation of metals under specific conditions as discussed in the method section. The data were evaluated and qualified with a "B" if the sample concentration was less than ten times the mean detected blank for the analytical batch.

LABORATORY CONTROL SAMPLES: A minimum of one LCS (OPR or blank spike) was prepared and analyzed with each analytical batch of 20 or fewer samples. Percent recoveries for LCS samples were within the QC acceptance criterion of 70% to 130% for all metals except Al (not spiked into the samples). The LCS matrix is Sequim Bay Seawater carried through the preconcentration and analytical processes. The quantification of Al is not considered a chemical of concern; therefore, the spiking levels are optimized for the other metals of interest. The accuracy of Al was evaluated on matrix spikes, freshwater SRMs, and high purity standards.

MATRIX SPIKE ACCURACY: A minimum of one set of duplicate matrix spikes (MS/MSD) was prepared and analyzed with each analytical batch of 20 or fewer samples. Percent recoveries for matrix spikes were within the QC limits of 70% to 130% for all metals.

REPLICATE PRECISION: Laboratory precision was expressed as the relative percent difference (RPD) between laboratory duplicates. The RPD values for the laboratory duplicates were within the QC acceptance criterion of ±30% for all metals detected above the RL.

STANDARD REFERENCE MATERIAL ACCURACY: Standard reference materials (SRM) were prepared and analyzed with each analytical batch at a minimum frequency of 1 per 20 or fewer samples. Analytical accuracy was expressed as the percent difference (PD) between the measured and the certified value. The SRM for Hg was 1641d, a freshwater SRM as no seawater SRM was available. The percent recoveries were within the QC acceptance criterion of 80-120%. The SRM for As was the coastal ocean SRM CASS-4. The percent recoveries were within the QC acceptance criterion. Two different SRMs were analyzed with the analytical batches for Al, Ag, Cd, Cr, Cu, Ni, Pb, and Zn quantified by ICP-MS.

The freshwater SRM 1640 demonstrated analytical accuracy for each batch analyzed by ICP-MS and the freshwater sample matrices (e.g. equipment blanks and outfall 021). Percent recoveries were within the QC acceptance criterion.

Two seawater SRMs were prepared with each batch of preconcentrated samples (CASS-5 and SLEW-2). The certified values for Cr and Pb were less than 10 times the MDL. Therefore, the data were flagged and only used to evaluate data set accuracy. The percent differences for these metals were also flagged with a "c" indicating they meet the contingency criterion. The seawater SRMs were not certified for Ag or Al. High purity standards and the freshwater SRM were used to evaluate analytical accuracy for these metals. The percent differences for CASS-5 were within the QC acceptance criterion with the exception of four values for Cd. The percent differences for SLEW-2 were within the QC acceptance criterion including Cd, suggesting the high recoveries measured in CASS-5 were not associated with analytical bias. Acceptable accuracy for all metals were demonstrated through multiple quality control samples.

COLUMBIA ANALYTICAL SERVICES, INC.

Client:	Batelle Marine Sciences Lab	**Service Request No.:**	K1009852
Project:	September 2010 Ambient Monitoring (AMB04)	**Date Received:**	9/10/10
Sample Matrix:	Ocean Water		

CASE NARRATIVE

All analyses were performed consistent with the quality assurance program of Columbia Analytical Services, Inc. (CAS). This report contains analytical results for samples designated for Tier III validation deliverables including summary forms and all of the associated raw data for each of the analyses. When appropriate to the method, method blank results have been reported with each analytical test.

Sample Receipt

69 ocean water samples were received for analysis at Columbia Analytical Services on 9/10/10. The samples were received in good condition and consistent with the accompanying chain of custody form. The samples were stored in a refrigerator at 4°C upon receipt at the laboratory.

General Chemistry Parameters

Upon review of dissolved versus total organic carbon (DOC and TOC) it was noted that the dissolved results exceeded the total by as much as 1.0 mg/L Carbon in some of the samples. This may indicate that the filtration process contributed low levels of organic carbon to the samples. We have experienced this problem in the laboratory (in this case the samples were received filtered for DOC) and have found that discarding the first liquid coming through the filter alleviates this problem.

No other anomalies associated with the analysis of these samples were observed.

Approved by Mike Skelton **Date** 10/12/10

CASE NARRATIVE

All analyses were performed consistent with the quality assurance program of Columbia Analytical Services, Inc. (CAS). This report contains analytical results for samples designated for Tier III validation deliverables including summary forms and all of the associated raw data for each of the analyses. When appropriate to the method, method blank results have been reported with each analytical test.

Sample Receipt

Twenty two sea water samples were received for analysis at Columbia Analytical Services on 9/11/10. The samples were received in good condition and consistent with the accompanying chain of custody form. The samples were stored in a refrigerator at 4°C upon receipt at the laboratory.

General Chemistry Parameters

Total Suspended Solids by SM 2540 D:
The Relative Percent Difference (RPD) criterion for the replicate analysis of Total Suspended Solids in sample AMB04-131 was not applicable because the analyte concentration was not significantly greater than the Method Reporting Limit (MRL). Analytical values derived from measurements close to the detection limit are not subject to the same accuracy and precision criteria as results derived from measurements higher on the calibration range for the method.

Total Solids by SM 2540 B:
In the initial run the sample AMB04-221 did not confirm it's duplicate. The sample was reanalyzed past holding time. The reanalysis was done in duplicate and the results of the reanalysis confirmed the duplicate of the original run. The results of the duplicate are reported as the sample. No further corrective action is necessary.

TOC and DOC by SM 5310C:
The total organic carbon (TOC) was lower that the dissolved organic carbon (DOC) for many samples analyzed. This may be due to slight contamination occurring during filtration.

No other anomalies associated with the analysis of these samples were observed.

Approved by Mike Shelton **Date** 11/4/10

Client / Project: Battelle Service Request K10 9898

Received: 9-11-10 Opened: 9-11-10 By: RC

1. Samples were received via? *Mail* *Fed Ex* *UPS* *DHL* *PDX* *Courier* *Hand Delivered*
2. Samples were received in: (circle) *Cooler* *Box* *Envelope* *Other*_____ *NA*
3. Were custody seals on coolers? NA Y N If yes, how many and where?_____
4. If present, were custody seals intact? Y N If present, were they signed and dated? Y N

Cooler Temp °C	Temp Blank °C	Thermometer ID	Cooler/COC ID NA	Tracking Number NA	Filed
2.6	NA	291	2 of 3	7939 0213 8950	
3.9	NA	305	1 of 3	7939 0213 8927	
3.8	NA	274	3 of 3	7939 0213 9086	

5. Packing material used. *Inserts* *Baggies* *Bubble Wrap* *Gel Packs* *Wet Ice* *Sleeves* *Other*_____
6. Were custody papers properly filled out (ink, signed, etc.)? NA Y N
7. Did all bottles arrive in good condition (unbroken)? *Indicate in the table below.* NA Y N
10. Were all sample labels complete (i.e analysis, preservation, etc.)? NA Y N
11. Did all sample labels and tags agree with custody papers? *Indicate major discrepancies in the table on page 2.* NA Y N
12. Were appropriate bottles/containers and volumes received for the tests indicated? NA Y N
13. Were the pH-preserved bottles (*see SMO GEN SOP*) received at the appropriate pH? *Indicate in the table below* NA Y N
14. Were VOA vials received without headspace? *Indicate in the table below.* NA Y N
15. Was C12/Res negative? NA Y N

Sample ID on Bottle	Sample ID on COC	Identified by:

Sample ID	Bottle Count Bottle Type	Out of Temp	Head-space	Broke	pH	Reagent	Volume added	Reagent Lot Number	Initials	Time

Metals in Water

DATA QUALIFIERS:

c	Exceeds DQO but meets contingency criteria of either:
1	SRM certified <10x MDL
2	Insufficient spiking level relative to native sample concentrations
3	Sample concentration <10x MDL
U	Analyte not detected at or above the MDL, MDL reported
J	Analyte detected above the MDL, but less than the RL
--	Not analyzed
NA	Not applicable/available
N	Spiked sample recovery outside QC criterion of 70-130%
NC	Not Certified
&	Accuracy result outside QC criterion of ≤20% PD
*	Precision result outside QC criterion of <30%
NS	Sample not spiked for this analyte
B	Analyte detected in the method blank > RL
	and sample concentration < 10 times detected blank value
b	Data are blank corrected using the batch specific procedural blank

PROJECT: Sinclair and Dyes Inlet Ambient Monitoring, November 2010 (AMB05)

PARAMETER: Total and Dissolved Metals – Al (Total only), Ag, As (Total only), Cd, Cr, Cu, Pb, Zn, Hg

LABORATORY: Battelle Marine Sciences Laboratory (MSL), Sequim, Washington

MATRIX: Seawater and Equipment Blanks (DI water matrix)

SAMPLE CUSTODY AND PROCESSING: Samples were collected from Sinclair and Dyes Inlet region by MSL and the U.S. Navy on 11/16/10 and 11/18/10. Samples were hand delivered the day of collection to MSL by the field team. All samples were received in good condition. Samples were assigned a Battelle Central File (CF) identification number (3106) and were entered into Battelle's sample tracking system. Upon receipt at MSL, the samples designated for total and dissolved metals (TME/DME) were shaken vigorously and approximately 500mL was filtered through a pre-cleaned 0.45µm polyvinylidene fluoride (PVDF) filter membrane inside a class 100 clean bench and the filtrate was transferred to a trace metal clean Teflon bottle. The dissolved and total fractions were each acidified to a pH of < 2.0 with double distilled nitric acid.

The following lists information on sample receipt and processing activities:

Sample Receipt Dates:	11/16/10 and 11/18/10
Cooler temp. on arrival	All coolers were at 4.0±2°C
Collection dates	11/16/10 and 11/18/10
CVAF analysis dates (Hg)	11/29/10, 12/03/10, 12/06/10, 12/07/10, 12/08/10, 12/13/10, and 12/15/10
TRM Prep/Freshwater Analysis by ICP-MS (Ag, Al, Cd, Cr, Cu, Pb, Zn)	11/23/10
Fe/Pd Preconcentration Seawater Analysis by ICP-MS (Ag, Al, Cd, Cr, Cu, Pb, Zn)	12/16/10, 01/05/11, 01/07/11, 01/10/11, 01/12/11
FIAS analysis date (As)	01/16/11

QA/QC DATA QUALITY OBJECTIVES FOR SEAWATER SAMPLES:

Analyte	Analytical Method for Seawater	MS Range of Recovery	SRM Percent Difference	Replicate Precision	Method Detection Limits (µg/L)	Reporting Limits (µg/L)
Aluminum	ICP-MS	70-130%	≤20%	≤30%	2.14	6.8

Copper	ICP-MS	70-130%	≤20%	≤30%	0.0053	0.02
Lead	ICP-MS	70-130%	≤20%	≤30%	0.0022	0.0070
Silver	ICP-MS	70-130%	≤20%	≤30%	0.0032	0.010
Zinc	ICP-MS	70-130%	≤20%	≤30%	0.02	0.06
Mercury	CVAF	70-130%	≤20%	≤30%	0.0001	0.00032

METHODS:

Seawater samples were analyzed for nine metals: aluminum (Al), arsenic (As), cadmium (Cd), chromium (Cr), copper (Cu), lead (Pb), silver (Ag), zinc (Zn), and mercury (Hg). Samples were submitted for analyses following three methods. The analyses of As and Hg do not require a salt removal technique prior to analyses, therefore, the data are not reported as reagent blank corrected (identified as a "b" qualifier) for these elements. All samples were analyzed for Hg by Cold Vapor Atomic Fluorescence (CVAF) in accordance with Battelle SOP *MSL-I-013, Total Mercury in Aqueous Samples by CVAF*, following EPA Method 1631 revision E. The samples for total metals (TME) were analyzed for As by Flow-Injection Atomic Spectroscopy (FIAS) in accordance with Battelle SOP *MSL-I-030, Determination of Metals in Aqueous and Digestate Samples by Hydride Generation Atomic Absorption (HGAA) with Flow Injection (FIAS).* The base method for this procedure is EPA Method 270.3.

Prior to analyses of all other metals, seawater samples were preconcentrated via a precipitation step followed by reconstituted in a salt free solution in accordance with Battelle SOP *MSL-I-025, Methods of Sample Preconcentration: Iron and Palladium/APDC Coprecipitation and Borohydride Reductive Precipitation for Trace Metals Analysis in Water*. Preconcentrated seawater samples were analyzed for Al (total only), Ag, Cd, Cr, Cu, Pb and Zn by Inductively Coupled Plasma-Mass Spectrometry (ICP-MS) in accordance with Battelle SOP *MSL-I-022, Determination of*

METHODS: *Elements in Aqueous and Digestate Samples by ICP/MS.* The base methods for this procedure are EPA Method 1638 and EPA Method 1640. Freshwater samples such as equipment blanks were digested using the total metal recoverable (TRM) method established in EPA Method 1640 prior to analysis by ICP-MS following SOP MSL-I-022.

All results were reported in units of µg/L. Data are reported as blank corrected for the metals requiring Fe/Pd preconcentration (Al, Ag, Cd, Cr, Cu, Ni, Pb, and Zn) and qualified with a b-flag. The required preconcentration procedure for ICP-MS analyses includes the addition of chelating agents to induce precipitation of metals under specific conditions. Subsequently, reagents added to the samples should be of the purest quality to result in zero addition of metals to the seawater samples. Required reagents have trace impurities of these metals; therefore, the data are blank corrected for these elements. Results were corrected using the mean batch reagent blank identified for each preparation batch as BMRB_analysis date and provided in the table identified as the QC Results for ICP-MS.

Equipment blank samples and field samples identified as < 5% seawater were analyzed as follows. Equipment blanks were created by MSL using the same lot of bottles and filter units cleaned for AMB05. They consist of deionized water collected in the Teflon sample bottle (1L) and filtered along with the AMB05 samples to generate both total metal (TME) equipment blanks and dissolved (DME) equipment blanks. The equipment blank samples were analyzed for Hg by CVAF as described above for the seawater. The freshwater matrix of equipment blanks does not require a preconcentration preparation prior to analysis for all other metals by ICP-MS. The preparation method for freshwater is a total recoverable metals (TRM) method described in EPA Method 1640 followed by analyses by ICP-MS as described above.

HOLDING TIMES: All samples were analyzed within the established holding times of 90 days for Hg and six months for all other metals.

DETECTION LIMITS: Laboratory method detection limits (MDLs) for seawater are reported from the Annual Seawater MDL Study as determined by seven replicates of Sequim Bay Seawater spiked at an appropriate concentration for each analyte. The freshwater MDL was reported from the Annual Freshwater MDL Study determined using seven replicates of deionized water prepared using the TRM preparation. Reporting limits are determined as 3.18 times the laboratory achieved MDL. The data are evaluated and flagged as follows:

U Analyte not detected at or above the MDL, MDL reported

J Analyte detected above the MDL, but less than the RL

N Spiked sample recovery outside QC criterion of 70-130%

& Accuracy result outside QC criterion of ≤20% PD

* Precision result outside QC criterion of <30%

B Analyte detected in the method blank > RL and sample concentration < 10 times detected blank value

c Exceeds data quality objective but meets contingency criterion

b Result is reagent blank corrected using the batch specific blank (BMRB)

METHOD BLANKS: A minimum of three method blanks were analyzed by each instrument with each analytical batch. The average method blank for each batch was less than the RL for all metals except Zn. The required preconcentration procedure to remove salt interferences prior to ICP-MS analysis includes the addition of chelating agents to induce precipitation of metals under specific conditions as discussed in the method section above. The data were evaluated and qualified with a "B" if the sample concentration was less than ten times the mean detected blank for the analytical batch. No data required this qualification.

LABORATORY CONTROL SAMPLES: A minimum of one LCS (OPR or blank spike) was prepared and analyzed with each analytical batch of 20 or fewer samples. Percent recoveries for LCS samples were within the QC acceptance criterion of 70% to 130% for all metals except Al (not spiked into the samples). The LCS matrix is Sequim Bay Seawater carried through the preconcentration and analytical processes. The quantification of Al is not considered a chemical of concern; therefore, the spiking levels are optimized for the other metals of interest. The accuracy of Al was evaluated on matrix spikes, freshwater SRMs, and high purity standards.

MATRIX SPIKE ACCURACY: A minimum of one set of duplicate matrix spikes (MS/MSD) was prepared and analyzed with each analytical batch of 20 or fewer samples. Percent recoveries for matrix spikes were within the QC limits of 70% to 130% for all metals.

REPLICATE PRECISION: Laboratory precision was expressed as the relative percent difference (RPD) between laboratory duplicates. The RPD values for the laboratory duplicates were within the QC acceptance criterion of ±30% for all metals detected above the RL.

STANDARD REFERENCE MATERIAL ACCURACY: Standard reference materials (SRM) were prepared and analyzed with each analytical batch at a minimum frequency of 1 per 20 or fewer samples. Analytical accuracy was expressed as the percent difference (PD) between the measured and the certified value. The SRM for Hg was 1641d, a freshwater SRM as no seawater SRM was available. The percent recoveries were within the QC acceptance criterion of 80-120%. The SRM for As was the coastal ocean SRM CASS-4. The percent recoveries were within the QC acceptance criterion. Two different SRMs were analyzed with the analytical batches for Al, Ag, Cd, Cr, Cu, Ni, Pb, and Zn quantified by ICP-MS.

The freshwater SRM 1640 demonstrated analytical accuracy for each batch analyzed by ICP-MS and the freshwater sample matrices (e.g. equipment blanks and outfall 021). Percent recoveries were within the QC acceptance criterion.

The estuarine SRM SLEW-2 was prepared with each batch of preconcentrated samples. The certified value for Pb was less than the RL and not appropriate for data validation. The percent differences were also flagged with a "c" indicating they meet the contingency criterion. The seawater SRM was not certified for Ag or Al. High purity standards and the freshwater SRM were used to evaluate analytical accuracy for these metals. The percent differences were within the QC acceptance criterion for all other metals.

TO BE COMPLETED UPON SAMPLE ARRIVAL/LOG-IN

Yes	No	N/A	Indicate in Appropriate Box
☐	☐	☑	Custody seal present — Seal intact? YES NO
☑	☐	☐	Cooler temperature (acceptable range: 4±2°C or solids:frozen) (if multiple coolers, note temp. of each) — 4.9, 5.8°C; 6.0, 4.5°C
☐	☐	☑	Project Manager notified of any custody/login discrepancies (cooler temp, sponsor codes, etc)
☑	☐	☐	Were all chain of custody forms signed and dated?
☑	☐	☐	Were samples filtered at MSL?

Comment/Remedy:

Sample condition(s): Acceptable / Other (explain):

Container type: Teflon / Poly / Glass / Cap. Vial / Other:

Notes:

Completed By: JMB Date/Time: 11/16/10 1900

SAMPLE PRESERVATION

☐		Sample(s) were preserved prior to arrival at MSL (noted on CoC / Sample / per PM Instruction)		
☐		Random pH checked for ~10% of samples (use dip paper)	Sample IDs:	
☐		Complete pH check required for project (use pH meter and record on pH Record form)		
☑		Sample(s) were preserved at MSL		
Type:	☑	0.2% HNO3	Notes: ~~1.0~~ 1.20	Lot# 1206090
	☐	0.5% HCl (Hg samples)	Notes:	Lot#
	☐	Refrigerate/Freeze	Notes:	
	☐	Other	Notes:	

Completed By: JMB Date/Time: 11/16/10

Storage Shelf: L-5-A, L-5-B, L-2-B

LOG-IN CHECKLIST

Reference SOP# MSL-A-001

Central File #: 31060 Sample No(s): Batch: 10

Project Name: SL0001 AMB05 Day 2 Project Manager: JMB

TO BE COMPLETED BY PROJECT MANAGER (prior to arrival when possible)

Matrix: seawater WP#

Yes	No	
	✓	Navy-type Project (requires high-level sample tracking procedures)
	✓	USDA Samples (see Compliance Agreement Checklist)

PM Verification:

✓		Filter Samples:	Amount: Entire sample (Half of sample)
	✓	Freeze dry sample(s) - samples will be weighed and placed in ultralow temp freezer (Login Lab)	
✓		Special instructions:	

Sample Preservation Instructions: 0.2% HNO_3

See LIMS for archive/disposal information

COLUMBIA ANALYTICAL SERVICES, INC.

Client:	Battelle	**Service Request No.:**	K1012978
Project:	ENVVEST: November 2010 Ambient Monitoring	**Date Received:**	11/18/10
Sample Matrix:	Water		

CASE NARRATIVE

All analyses were performed consistent with the quality assurance program of Columbia Analytical Services, Inc. (CAS). This report contains analytical results for samples designated for Tier III validation deliverables including summary forms and all of the associated raw data for each of the analyses. When appropriate to the method, method blank results have been reported with each analytical test.

Sample Receipt

Seventy-five water samples were received for analysis at Columbia Analytical Services on 11/18/10. The samples were received in good condition and consistent with the accompanying chain of custody form. The samples were stored in a refrigerator at 4°C upon receipt at the laboratory.

General Chemistry Parameters

Total Kjeldahl Nitrogen by EPA Method 351.4:

The matrix spike recovery of TKN for sample AMB05 DD-003 PSN019MS was outside control criteria because of suspected matrix interference. The sample was re-extracted and re-analyzed, but produced similar results. The results of the original analysis were reported. No further corrective action was appropriate.

Dissolved Organic Carbon by Standard Method 5310 C:

The matrix spike recovery of Dissolved Organic Carbon for sample AMB05DD-009 PSNS018 was outside control criteria. The matrix spike was reanalyzed and confirmed the original results. Recovery in the Laboratory Control Sample (LCS) was acceptable, which indicated the analytical batch was in control. The matrix spike outlier suggested a potential low bias in this matrix. No further corrective action was appropriate.

No other anomalies associated with the analysis of these samples were observed.

COLUMBIA ANALYTICAL SERVICES, INC.

Client:	Battelle Marine Sciences Lab	**Service Request No.:**	K1013104
Project:	November 2010 Ambient Monitoring (AMB05)	**Date Received:**	11/20/10
Sample Matrix:	Water		

CASE NARRATIVE

All analyses were performed consistent with the quality assurance program of Columbia Analytical Services, Inc. (CAS). This report contains analytical results for samples designated for Tier III validation deliverables including summary forms and all of the associated raw data for each of the analyses. When appropriate to the method, method blank results have been reported with each analytical test.

Sample Receipt

Sixty-six water samples were received for analysis at Columbia Analytical Services on 11/20/10. The samples were received in good condition and consistent with the accompanying chain of custody form. The samples were stored in a refrigerator at 4°C upon receipt at the laboratory.

General Chemistry Parameters

Dissolved Organic Carbon by SM 5310 C:
The matrix spike recovery of Dissolved Organic Carbon for sample AMB05-504 PA07 was outside control criteria because of suspected matrix interference. A matrix spike duplicate was also analyzed, but produced similar results. The results of the original analysis were reported. No further corrective action was appropriate.

No other anomalies associated with the analysis of these samples were observed.

Client / Project: Battelle Service Request K10 13104

Received: 11/20/10 Opened: 11/20/10 By: MA

1. Samples were received via? *Mail* (*Fed Ex*) *UPS* *DHL* *PDX* *Courier* *Hand Delivered*
2. Samples were received in: (circle) (*Cooler*) *Box* *Envelope* *Other* _____ *NA*
3. Were custody seals on coolers? NA Y (N) If yes, how many and where? _____
   If present, were custody seals intact? Y N If present, were they signed and dated? Y N

Cooler Temp °C	Temp Blank °C	Thermometer ID	Cooler/COC ID (NA)	Tracking Number NA	Filed
1.0	—	297	/	7964 7174 3090	✓
3.9	—	287		7964 7174 2830	✓
1.6	—	280		7964 7174 2954	✓

7. Packing material used. *Inserts* *Baggies* (*Bubble Wrap*) (*Gel Packs*) *Wet Ice* *Sleeves* *Other* _____
8. Were custody papers properly filled out (ink, signed, etc.)? NA (Y) N
9. Did all bottles arrive in good condition (unbroken)? *Indicate in the table below.* NA (Y) N
10. Were all sample labels complete (i.e analysis, preservation, etc.)? NA (Y) N
11. Did all sample labels and tags agree with custody papers? *Indicate major discrepancies in the table on page 2.* NA (Y) N
12. Were appropriate bottles/containers and volumes received for the tests indicated? NA (Y) N
13. Were the pH-preserved bottles (*see SMO GEN SOP*) received at the appropriate pH? *Indicate in the table below* NA (Y) N
14. Were VOA vials received without headspace? *Indicate in the table below.* (NA) Y N
15. Was C12/Res negative? (NA) Y N

Sample ID on Bottle	Sample ID on COC	Identified by:

Sample ID	Bottle Count Bottle Type	Out of Temp	Head-space	Broke	pH	Reagent	Volume added	Reagent Lot Number	Initials	Time

Notes, Discrepancies, & Resolutions: _____

Analytical Chemistry Data Package

Revised 7/11/11 to include TOC/DOC data.

Project: ENVVEST Ambient Monitoring March 2011 (AMB06)

ENVVEST AMB06_March 2011
Metals in Water

DATA QUALIFIERS:

c	Exceeds DQO but meets contingency criteria of either:
1	SRM certified <10x MDL
2	Insufficient spiking level relative to native sample concentrations
3	Sample concentration <10x MDL
U	Analyte not detected at or above the MDL, MDL reported
J	Analyte detected above the MDL, but less than the RL
--	Not analyzed
NA	Not applicable/available
N	Spiked sample recovery outside QC criterion of 70-130%
NC	Not Certified
&	Accuracy result outside QC criterion of ≤20% PD
*	Precision result outside QC criterion of <30%
NS	Sample not spiked for this analyte
B	Analyte detected in the method blank > RL
	and sample concentration < 10 times detected blank value
b	Data are blank corrected using the batch specific procedural blank

PROJECT: Sinclair and Dyes Inlet Ambient Monitoring, March 2011 (AMB06)

PARAMETER: Total and Dissolved Metals – Al, Ag, As (Total only), Cd, Cr, Cu, Pb, Zn, Hg
Total Suspended Solids (TSS)

LABORATORY: Battelle Marine Sciences Laboratory (MSL), Sequim, Washington

MATRIX: Seawater and Equipment Blanks (DI water matrix)

SAMPLE CUSTODY AND PROCESSING: Samples were collected from Sinclair and Dyes Inlet region by MSL and the U.S. Navy on 03/22/11 and 03/23/11. Samples were hand delivered the day of collection to MSL by the field team. All samples were received in good condition. Samples were assigned a Battelle Central File (CF) identification number (3106) and were entered into Battelle's sample tracking system. Upon receipt at MSL, the samples designated for total and dissolved metals (TME/DME) were shaken vigorously and approximately 500mL was filtered through a pre-cleaned 0.45µm polyvinylidene fluoride (PVDF) filter membrane inside a class 100 clean bench and the filtrate was transferred to a trace metal clean Teflon bottle. The dissolved and total fractions were each acidified to a pH of < 2.0 with double distilled nitric acid.

The samples for TSS were stored at 4.0±2°C in low density polyethylene bottles prior to analysis.

The following lists information on sample receipt and processing activities:

Sample Receipt Dates:	03/22/11 and 03/23/11
Cooler temp. on arrival	All coolers were at 4.0±2°C
Collection dates	03/22/11 and 03/23/11
TSS analysis dates	03/24/11
CVAF analysis dates (Hg)	03/31/11, 04/01/11, 04/04/11, 04/06/11, and 04/08/11
TRM Prep/Freshwater Analysis by ICP-MS (Ag, Al, Cd, Cr, Cu, Pb, Zn)	03/28/11 and 04/06/11
Fe/Pd Preconcentration Seawater Analysis by ICP-MS (Ag, Al, Cd, Cr, Cu, Pb, Zn)	04/08/11, 04/11/011, 04/12/11, 04/13/11, and 04/14/11
FIAS analysis date (As)	04/13/11

QA/QC DATA QUALITY OBJECTIVES FOR SEAWATER SAMPLES:

Mercury	CVAF	70-130%	≤20%	≤30%	0.0001	0.00032

METHODS:

Seawater samples were analyzed for nine metals: aluminum (Al), arsenic (As), cadmium (Cd), chromium (Cr), copper (Cu), lead (Pb), silver (Ag), zinc (Zn), and mercury (Hg). Samples were submitted for analyses following three methods. The analyses of As and Hg do not require a salt removal technique prior to analyses, therefore, the data are not reported as reagent blank corrected (identified as a "b" qualifier) for these elements. All samples were analyzed for Hg by Cold Vapor Atomic Fluorescence (CVAF) in accordance with Battelle SOP *MSL-I-013, Total Mercury in Aqueous Samples by CVAF*, following EPA Method 1631 revision E. The samples for total metals (TME) were analyzed for As by Flow-Injection Atomic Spectroscopy (FIAS) in accordance with Battelle SOP *MSL-I-030, Determination of Metals in Aqueous and Digestate Samples by Hydride Generation Atomic Absorption (HGAA) with Flow Injection (FIAS).* The base method for this procedure is EPA Method 270.3.

Prior to analyses of all other metals, seawater samples were preconcentrated via a precipitation step followed by reconstituted in a salt free solution in accordance with Battelle SOP *MSL-I-025, Methods of Sample Preconcentration: Iron and Palladium/APDC Coprecipitation and Borohydride Reductive Precipitation for Trace Metals Analysis in Water.* Preconcentrated seawater samples were analyzed for Al

METHODS:

(total only), Ag, Cd, Cr, Cu, Pb and Zn by Inductively Coupled Plasma-Mass Spectrometry (ICP-MS) in accordance with Battelle SOP *MSL-I-022, Determination of Elements in Aqueous and Digestate Samples by ICP/MS.* The base methods for this procedure are EPA Method 1638 and EPA Method 1640. Freshwater samples such as equipment blanks were digested using the total metal recoverable (TRM) method established in EPA Method 1640 prior to analysis by ICP-MS following SOP MSL-I-022.

All metal results were reported in units of µg/L. Data are reported as blank corrected for the metals requiring Fe/Pd preconcentration (Al, Ag, Cd, Cr, Cu, Ni, Pb, and Zn) and qualified with a b-flag. The required preconcentration procedure for ICP-MS analyses includes the addition of chelating agents to induce precipitation of metals under specific conditions. Subsequently, reagents added to the samples should be of the purest quality to result in zero addition of metals to the seawater samples. Required reagents have trace impurities of these metals; therefore, the data are blank corrected for these elements. Results were corrected using the mean batch reagent blank identified for each preparation batch as BMRB_analysis date and provided in the table identified as the QC Results for ICP-MS.

Equipment blank samples and field samples identified as < 5% seawater were analyzed as follows. Equipment blanks were created by MSL using the same lot of bottles and filter units cleaned for AMB06. They consist of deionized water collected in the Teflon sample bottle (1L) and filtered along with the AMB06 samples to generate both total metal (TME) equipment blanks and dissolved (DME) equipment blanks. The equipment blank samples were analyzed for Hg and As as described above for the seawater. The freshwater matrix of equipment blanks does not require a preconcentration preparation prior to analysis for all other metals by ICP-MS. The preparation method for freshwater is a total recoverable metals (TRM) method described in EPA Method 1640 followed by analyses by ICP-MS as described above.

The TSS samples were analyzed following SM2540D using a gravimetric analysis. The data are reported in units of mg/L.

HOLDING TIMES: All samples were analyzed within the established holding times of 90 days for Hg, six months for all other metals, and 7 days for TSS.

DETECTION LIMITS: Laboratory method detection limits (MDLs) for seawater are reported from the Annual Seawater MDL Study as determined by seven replicates of Sequim Bay Seawater spiked at an appropriate concentration for each analyte. The freshwater MDL was reported from the Annual Freshwater MDL Study determined using seven replicates of deionized water prepared using the TRM preparation. Reporting limits are determined as 3.18 times the laboratory achieved MDL. The data are evaluated and flagged as follows:

U Analyte not detected at or above the MDL, MDL reported

J Analyte detected above the MDL, but less than the RL

N Spiked sample recovery outside QC criterion of 70-130%

& Accuracy result outside QC criterion of ≤20% PD

* Precision result outside QC criterion of <30%

B Analyte detected in the method blank > RL and sample concentration < 10 times detected blank value

c Exceeds data quality objective but meets contingency criterion

b Result is reagent blank corrected using the batch specific blank (BMRB)

METHOD BLANKS: A minimum of three method blanks were analyzed by each instrument with each analytical batch for metals. The average method blank for each batch was less than the RL for all metals except Zn and Cr. The required preconcentration procedure to remove salt interferences prior to ICP-MS analysis includes the addition of chelating agents to induce precipitation of metals under specific conditions as discussed in the method section above. The data were evaluated and qualified with a "B" if the sample concentration was less than ten times the mean detected blank for the analytical batch.

The method blanks for the freshwater analytical batches identified as 032811-6100 and 040611-6100 contained detectable Zn above the RL. The data were evaluated and only the samples in batch 032811-6100 required qualification with a B. These were equipment blanks that suggested there was a small contribution of Zn from the filtering process and TRM process. The filter blanks were analyzed without the TRM preparation and showed the Zn attributed to the filtration was only present when the sample was acid solubilized. Since the seawater samples are chelated first then solubilized with acid, the Zn attributed to the filter units would not likely impact the concentration of the seawater samples. The data are not considered significantly impacted as a majority of the dissolved Zn values were less than the total Zn. In seawater Zn occurs primarily in the dissolved phase, therefore any contribution from the filtration process would result in a dissolved fraction higher than the total.

The method blank for TSS is a glass fiber filter taken through the analytical process with each batch of samples. The blanks were all less than the MDL.

LABORATORY CONTROL SAMPLES: A minimum of one LCS (OPR or blank spike) was prepared and analyzed with each analytical batch of 20 or fewer samples. Percent recoveries for LCS samples were within the QC acceptance criterion of 70% to 130% for all metals except Al (not spiked into the samples). The LCS matrix is Sequim Bay Seawater carried through the preconcentration and analytical processes. The quantification of Al is not considered a chemical of concern; therefore, the spiking levels are optimized for the other metals of interest. The accuracy of Al was evaluated using freshwater SRMs and high purity standards.

MATRIX SPIKE ACCURACY: A minimum of one set of duplicate matrix spikes (MS/MSD) was prepared and analyzed with each analytical batch of 20 or fewer samples for metals. Percent recoveries for matrix spikes were within the QC limits of 70% to 130% for all metals (except Al, which is not a metal of concern).

REPLICATE PRECISION: Laboratory precision was expressed as the relative percent difference (RPD) between laboratory duplicates. The RPD values for the laboratory duplicates were within the QC acceptance criterion of ±30% for all metals detected above the RL except one duplicate for Cr (44%). Acceptable precision for Cr was demonstrated in alternate QC samples.

STANDARD REFERENCE MATERIAL ACCURACY: Standard reference materials (SRM) were prepared and analyzed with each analytical batch at a minimum frequency of 1 per 20 or fewer samples. Analytical accuracy was expressed as the percent difference (PD) between the measured and the certified value. The SRM for Hg was 1641d, a freshwater SRM as no seawater SRM was available. The percent recoveries were within the QC acceptance criterion of 80-120%. The SRM for As was the coastal ocean SRM CASS-4. The percent recoveries were within

the QC acceptance criterion.

Two different SRMs were analyzed with the analytical batches for Al, Ag, Cd, Cr, Cu, Ni, Pb, and Zn quantified by ICP-MS. The freshwater SRM 1640 demonstrated analytical accuracy for each batch analyzed by ICP-MS and the freshwater sample matrices (e.g. equipment blanks and outfall 021). Percent recoveries were within the QC acceptance criterion.

The estuarine SRM SLEW-2 was prepared with each batch of preconcentrated samples. The certified value for Pb was less than the RL and not appropriate for data validation. The percent differences were also flagged with a “c” indicating they meet the contingency criterion. The seawater SRM was not certified for Ag or Al. High purity standards and the freshwater SRM were used to evaluate analytical accuracy for these metals. The percent differences were within the QC acceptance criterion for all other metals except one replicate for Cd (21%) and one for Cr (25%). Acceptable analytical accuracy for these metals was demonstrated in alternate QC samples.

LOG-IN CHECKLIST

Reference SOP# MSL-A-001

Central File #: 3106 Sample No(s): 391 - ~~449~~ 450 & 3/23/11 Batch:

Project Name: AMB06 / ENVVEST Project Manager: JM3

TO BE COMPLETED BY PROJECT MANAGER (prior to arrival when possible)

Matrix: seawater WP#

Yes	No	
☐	☑	Navy-type Project (requires high-level sample tracking procedures)
☐	☑	USDA Samples (see Compliance Agreement Checklist)

PM Verification:

☑	☐	Filter Samples:	Amount: Entire sample Half of sample
☐	☑	Freeze dry sample(s) - samples will be weighed and placed in ultralow temp freezer (Login Lab)	
☑	☐	Special instructions:	send nutrients & oil and grease to CAS

Sample Preservation Instructions: see QAP

See LIMS for archive/disposal information

TO BE COMPLETED UPON SAMPLE ARRIVAL/LOG-IN

Yes	No	N/A	Indicate in Appropriate Box
☐	☐	☑	Custody seal present Seal intact? YES NO
☑	☐	☐	Cooler temperature (acceptable range: 4±2°C or solids:frozen) (if multiple coolers, note temp. of each)
☐	☐	☑	Project Manager notified of any custody/login discrepancies (cooler temp, sponsor codes, etc)
☑	☐	☐	Were all chain of custody forms signed and dated?
☑	☐	☐	Were samples filtered at MSL?

Hand delivered

°C

°C

Comment/Remedy:

Sample condition(s): ~~Acceptable~~ Other (explain):

Container type: ~~Teflon~~ ~~Poly~~ ~~Glass~~ Cap. Vial Other:

Notes: Filter blks created @ MSL

Completed By: Date/Time: 3/22/11 2025

SAMPLE PRESERVATION

☐ Sample(s) were preserved prior to arrival at MSL (noted on CoC / Sample / per PM Instruction)

☐ Random pH checked for ~10% of samples (use dip paper) Sample IDs:

☐ Complete pH check required for project (use pH meter and record on pH Record form)

☑ Sample(s) were preserved at MSL (Metals)

Type: ☑	0.2% HNO3	Notes:	Lot# 12100880 *
☐	0.5% HCl (Hg samples)	Notes:	Lot#
☐	Refrigerate/Freeze	Notes:	
☐	Other	Notes:

LOG-IN CHECKLIST

Reference SOP# MSL-A-001

Central File #: 3106 Sample No(s): 451 - 492 Batch: 12

Project Name: AMB06 Day 2 Project Manager: JMB

TO BE COMPLETED BY PROJECT MANAGER (prior to arrival when possible)

Matrix: seawater WP#

Yes	No	
☐	☑	Navy-type Project (requires high-level sample tracking procedures)
☐	☑	USDA Samples (see Compliance Agreement Checklist)

PM Verification:

☑	☐	Filter Samples:	Amount: Entire sample Half of sample
☐	☑	Freeze dry sample(s) - samples will be weighed and placed in ultralow temp freezer (Login Lab)	
☑	☐	Special instructions:	send nutrients to CAS

Sample Preservation Instructions: Various see QAPP

See LIMS for archive/disposal information

TO BE COMPLETED UPON SAMPLE ARRIVAL/LOG-IN

Yes	No	N/A	Indicate in Appropriate Box
☐	☐	☑	Custody seal present Seal intact? YES NO
☑	☐	☐	Cooler temperature (acceptable range: 4±2°C or solids:frozen) (if multiple coolers, note temp. of each)
☐	☐	☑	Project Manager notified of any custody/login discrepancies (cooler temp, sponsor codes, etc)
☑	☐	☐	Were all chain of custody forms signed and dated?
☑	☐	☐	Were samples filtered at MSL?

Hand delivered from field 8 °C °C

COLUMBIA ANALYTICAL SERVICES, INC.

Client:	Battelle Marine Sciences Lab	**Service Request No.:**	K1102517
Project:	ENVVEST March 2011 AMB06	**Date Received:**	3/24/11
Sample Matrix:	Water		

CASE NARRATIVE

All analyses were performed consistent with the quality assurance program of Columbia Analytical Services, Inc. (CAS). This report contains analytical results for samples designated for Tier IV validation deliverables including summary forms and all of the associated raw data for each of the analyses. When appropriate to the method, method blank results have been reported with each analytical test.

Sample Receipt

Twenty eight water samples were received for analysis at Columbia Analytical Services on 3/24/11. The samples were received in good condition and consistent with the accompanying chain of custody form. The samples were stored in a refrigerator at 4°C upon receipt at the laboratory.

General Chemistry Parameters

Total Oil and Grease by EPA Method 1664:
The matrix spike recovery of Total Oil and Grease for sample Batch QC was outside control criteria because of suspected matrix interference. As a result of the interference, the results for this analyte contained a potential low bias. No further corrective action was taken.

Ammonia as Nitrogen by EPA Method 350.1:
The Relative Percent Difference (RPD) criterion for the replicate analysis of Ammonia as Nitrogen in sample AMB06-003 PS07 was not applicable because the analyte concentration was not significantly greater than the Method Reporting Limit (MRL). Analytical values derived from measurements close to the detection limit are not subject to the same accuracy and precision criteria as results derived from measurements higher on the calibration range for the method.

Total Kjeldahl Nitrogen by EPA Method 351.4:
The matrix spike recovery of Total Kjeldahl Nitrogen for sample AMB06-168 PS07DUP was outside control criteria because of suspected matrix interference. As a result of the interference, the results for this analyte contained a potential high bias. No further corrective action was taken.

No other anomalies associated with the analysis of these samples were observed.

COLUMBIA ANALYTICAL SERVICES, INC.

Client:	Battelle Marine Sciences Lab	**Service Request No.:**	K1102580
Project:	March 2011 Ambient Monitoring (AMB06)	**Date Received:**	3/25/11
Sample Matrix:	Water		

CASE NARRATIVE

All analyses were performed consistent with the quality assurance program of Columbia Analytical Services, Inc. (CAS). This report contains analytical results for samples designated for Tier IV validation deliverables including summary forms and all of the associated raw data for each of the analyses. When appropriate to the method, method blank results have been reported with each analytical test.

Sample Receipt

Nineteen water samples were received for analysis at Columbia Analytical Services on 3/25/11. The samples were received in good condition and consistent with the accompanying chain of custody form. The samples were stored in a refrigerator at 4°C upon receipt at the laboratory.

General Chemistry Parameters

No anomalies associated with the analysis of these samples were observed.

COLUMBIA ANALYTICAL SERVICES, INC.

Client:	Battelle	**Service Request No.:**	K1105643
Project:	March 2011 AMB06	**Date Received:**	6/22/11
Sample Matrix:	Water		

CASE NARRATIVE

All analyses were performed consistent with the quality assurance program of Columbia Analytical Services, Inc. (CAS). This report contains analytical results for samples designated for Tier IV validation deliverables including summary forms and all of the associated raw data for each of the analyses. When appropriate to the method, method blank results have been reported with each analytical test.

Sample Receipt

Eighty-two water samples were received for analysis at Columbia Analytical Services on 6/22/11. The samples were received in good condition and consistent with the accompanying chain of custody form with the following exceptions. We did not receive sample AMB06DD-015. Samples AMB06-120, AMB06-327 & AMB06DD-014 were received broken. The samples were stored in a refrigerator at 4°C upon receipt at the laboratory.

General Chemistry Parameters

Dissolved Organic Carbon by Standard Method 5310 C, Total Organic Carbon by Standard Method 5310 C: All samples were received past holding time. The analysis was performed as soon as possible after receipt by the laboratory. The data was flagged to indicate the holding time violation.

No other anomalies associated with the analysis of these samples were observed.

Analyte Name	**Method**	**Result**	**Spike Amount**	**% Rec**	**% Rec Limits**
Carbon, Total Organic	SM 5310 C	25.5	26.0	98	83 - 117

Results flagged with an asterisk (*) indicate values outside control criteria.

Percent recoveries and relative percent differences (RPD) are determined by the software using values in the calculation which have not been rounded.

Client: Battelle Marine Sciences Lab
Project: March 2011 Ambient Monitoring (AMB06)
Sample Matrix: Ocean Water

Service Request: K1105643
Date Analyzed: 6/24/11

ENVVEST Ambient Monitoring (AMB07)
ENVVEST June 2011
Metals in Water

DATA QUALIFIERS:

c	Exceeds DQO but meets contingency criteria of either:
1	SRM certified <10x MDL
2	Insufficient spiking level relative to native sample concentrations
3	Sample concentration <10x MDL
U	Analyte not detected at or above the MDL, MDL reported
J	Analyte detected above the MDL, but less than the RL
--	Not analyzed
NA	Not applicable/available
N	Spiked sample recovery outside QC criterion of 70-130%
NC	Not Certified
&	Accuracy result outside QC criterion of ≤20% PD
*	Precision result outside QC criterion of <30%
NS	Sample not spiked for this analyte
B	Analyte detected in the method blank > RL
	and sample concentration < 10 times detected blank value
b	Data are blank corrected using the batch specific procedural blank

QA/QC NARRATIVE

PROJECT: Sinclair and Dyes Inlet Ambient Monitoring, June 2011 (AMB07)

PARAMETER: Total and Dissolved Metals – Al, Ag, As (Total only), Cd, Cr, Cu, Pb, Zn, Hg
Total Suspended Solids (TSS)

LABORATORY: Battelle Marine Sciences Laboratory (MSL), Sequim, Washington

MATRIX: Seawater and Equipment Blanks (DI water matrix)

SAMPLE CUSTODY AND PROCESSING: Samples were collected from Sinclair and Dyes Inlet region by MSL and the U.S. Navy on 06/21/11 and 06/22/11. Samples were hand delivered the day of collection to MSL by the field team. All samples were received in good condition. Samples were assigned a Battelle Central File (CF) identification number (3106) and were entered into Battelle's sample tracking system. Upon receipt at MSL, the samples designated for total and dissolved metals (TME/DME) were shaken vigorously and approximately 500mL was filtered through a pre-cleaned 0.45µm polyvinylidene fluoride (PVDF) filter membrane inside a class 100 clean bench and the filtrate was transferred to a trace metal clean Teflon bottle. The dissolved and total fractions were each acidified to a pH of < 2.0 with double distilled nitric acid.

The samples for TSS were stored at 4.0±2°C in low density polyethylene bottles prior to analysis.

The following lists information on sample receipt and processing activities:

Sample Receipt Dates:	06/21/11 and 06/22/11
Cooler temp. on arrival	All coolers were at 4.0±2°C
Collection dates	06/21/11 and 06/22/11
TSS analysis dates	06/22/11 and 06/23/11
CVAF analysis dates (Hg)	06/27/11, 06/28/11, 06/29/11, 06/30/11, 07/01/11, 07/05/11
TRM Prep/Freshwater Analysis by ICP-MS (Ag, Al, Cd, Cr, Cu, Ni, Pb, Zn)	06/29/11
Fe/Pd Preconcentration Seawater Analysis by ICP-MS (Ag, Al, Cd, Cr, Cu, Ni, Pb, Zn)	07/15/11, 07/31/11, 08/11/11, 08/25/11, 08/31/11, 09/02/11
FIAS analysis date (As)	07/07/11

QA/QC NARRATIVE

METHODS:

Seawater samples were analyzed for ten metals: aluminum (Al), arsenic (As), cadmium (Cd), chromium (Cr), copper (Cu), nickel (Ni), lead (Pb), silver (Ag), zinc (Zn), and mercury (Hg). Samples were submitted for analyses following three methods. The analyses of As and Hg do not require a salt removal technique prior to analyses, therefore, the data are not reported as reagent blank corrected (identified as a "b" qualifier) for these elements. All samples were analyzed for Hg by Cold Vapor Atomic Fluorescence (CVAF) in accordance with Battelle SOP *MSL-I-013*, *Total Mercury in Aqueous Samples by CVAF*, following EPA Method 1631 revision E. The samples for total metals (TME) were analyzed for As by Flow-Injection Atomic Spectroscopy (FIAS) in accordance with Battelle SOP *MSL-I-030, Determination of Metals in Aqueous and Digestate Samples by Hydride Generation Atomic Absorption (HGAA) with Flow Injection (FIAS).* The base method for this procedure is EPA Method 270.3.

Prior to analyses of all other metals, seawater samples were preconcentrated via a

METHODS (cont): precipitation step followed by reconstituted in a salt free solution in accordance with Battelle SOP *MSL-I-025, Methods of Sample Preconcentration: Iron and Palladium/APDC Coprecipitation and Borohydride Reductive Precipitation for Trace Metals Analysis in Water.* Preconcentrated seawater samples were analyzed for Al (total only), Ag, Cd, Cr, Cu, Pb and Zn by Inductively Coupled Plasma-Mass Spectrometry (ICP-MS) in accordance with Battelle SOP *MSL-I-022, Determination of Elements in Aqueous and Digestate Samples by ICP/MS.* The base methods for this procedure are EPA Method 1638 and EPA Method 1640. Freshwater samples such as equipment blanks were digested using the total metal recoverable (TRM) method established in EPA Method 1640 prior to analysis by ICP-MS following SOP MSL-I-022.

All metal results were reported in units of µg/L. Data are reported as blank corrected for the metals requiring Fe/Pd preconcentration (Al, Ag, Cd, Cr, Cu, Ni, Pb, and Zn) and qualified with a b-flag. The required preconcentration procedure for ICP-MS analyses includes the addition of chelating agents to induce precipitation of metals under specific conditions. Subsequently, reagents added to the samples should be of the purest quality to result in zero addition of metals to the seawater samples. Required reagents have trace impurities of these metals; therefore, the data are blank corrected for these elements. Results were corrected using the mean batch reagent blank identified for each preparation batch as BMRB_analysis date and provided in the table identified as the QC Results for ICP-MS.

Equipment blank samples and field samples identified as < 5% seawater were analyzed as follows. Equipment blanks were created by MSL using the same lot of bottles and filter units cleaned for AMB07. They consist of deionized water collected in the Teflon sample bottle (1L) and filtered along with the AMB07 samples to generate both total metal (TME) equipment blanks and dissolved (DME) equipment blanks. The equipment blank samples were analyzed for Hg and As as described above for the seawater. The freshwater matrix of equipment blanks does not require a preconcentration preparation prior to analysis for all other metals by ICP-MS. The preparation method for freshwater is a total recoverable metals (TRM) method described in EPA Method 1640 followed by analyses by ICP-MS as described above.

The TSS samples were analyzed following SM2540D using a gravimetric analysis. The data are reported in units of mg/L.

HOLDING TIMES: All samples were analyzed within the established holding times of 90 days for Hg, six months for all other metals, and 7 days for TSS.

DETECTION LIMITS: Laboratory method detection limits (MDLs) for seawater are reported from the Annual Seawater MDL Study as determined by seven replicates of Sequim Bay Seawater spiked at an appropriate concentration for each analyte. The freshwater MDL was reported from the Annual Freshwater MDL Study determined using seven replicates of deionized water prepared using the TRM preparation. Reporting limits are determined as 3.18 times the laboratory achieved MDL. The data are evaluated and flagged as follows:

U Analyte not detected at or above the MDL, MDL reported

J Analyte detected above the MDL, but less than the RL

N Spiked sample recovery outside QC criterion of 70-130%

& Accuracy result outside QC criterion of ≤20% PD

* Precision result outside QC criterion of <30%

B Analyte detected in the method blank > RL and sample concentration < 10 times detected blank value

c Exceeds data quality objective but meets contingency criterion

b Result is reagent blank corrected using the batch specific blank (BMRB)

METHOD BLANKS: A minimum of three method blanks were analyzed by each instrument with each analytical batch for metals. The average method blank for each batch was less than the RL for all metals except Zn. The required preconcentration procedure to remove salt interferences prior to ICP-MS analysis includes the addition of chelating agents to induce precipitation of metals under specific conditions as discussed in the method section above. The data were evaluated and qualified with a "B" if the sample concentration was less than ten times the mean detected blank for the analytical batch. The reagent blank correction takes into consideration the detected blank for each batch and the data should be reported as corrected in order to more accurately represent the Zn concentrations.

The method blanks for the freshwater analytical batches were not detected above the RL.

The method blank for TSS is a glass fiber filter taken through the analytical process with each batch of samples. The blanks were all less than the MDL.

LABORATORY CONTROL SAMPLES: A minimum of one LCS (OPR or blank spike) was prepared and analyzed with each analytical batch of 20 or fewer samples. Percent recoveries for LCS samples were within the QC acceptance criterion of 70% to 130% for all metals. The LCS matrix for the seawater samples was Sequim Bay Seawater prepared as both spiked and unspiked samples.

MATRIX SPIKE ACCURACY: A minimum of one set of duplicate matrix spikes (MS/MSD) was prepared and analyzed with each analytical batch of 20 or fewer samples for metals. Percent recoveries for matrix spikes were within the QC limits of 70% to 130% for all metals.

REPLICATE PRECISION: Laboratory precision was expressed as the relative percent difference (RPD) between laboratory duplicates. The RPD values for the laboratory duplicates were within the QC acceptance criterion of ±30% for all metals detected above the RL.

STANDARD REFERENCE MATERIAL ACCURACY: Standard reference materials (SRM) were prepared and analyzed with each analytical batch at a minimum frequency of 1 per 20 or fewer samples. Analytical accuracy was expressed as the percent difference (PD) between the measured and the certified value. The SRM for Hg was 1641d, a freshwater SRM, as no seawater SRM was available. The percent recoveries were within the QC acceptance criterion of 80-120%. The SRM for As was the coastal ocean SRM CASS-4. The percent recoveries were within the QC acceptance criterion.

Three different SRMs were analyzed with the analytical batches for Al, Ag, Cd, Cr, Cu, Ni, Pb, and Zn quantified by ICP-MS. The freshwater SRM 1640 (either a or d) demonstrated analytical accuracy for each batch analyzed by ICP-MS and the freshwater sample matrices (e.g. equipment blanks and outfall 021). Percent recoveries were within the QC acceptance criterion.

Two seawater SRMs were analyzed with each batch. The estuarine SRM SLEW-2 and

coastal SRM CASS-5 were prepared with each batch of preconcentrated samples. The certified value for Pb was less than the RL and not appropriate for data validation. The percent differences were also flagged with a “c” indicating they meet the contingency criterion. The seawater SRM was not certified for Ag or Al. High purity standards and the freshwater SRM were used to evaluate analytical accuracy for these metals. The percent differences were within the QC acceptance criterion for all other metals except one replicate for Cu (23%). Acceptable analytical accuracy for Cu was demonstrated in alternate QC samples.

COLUMBIA ANALYTICAL SERVICES, INC.

Client:	Battelle Marine Sciences Lab	**Service Request No.:**	K1105673
Project:	June 2011 Ambient Monitoring (AMB07)	**Date Received:**	6/23/11
Sample Matrix:	Water		

CASE NARRATIVE

All analyses were performed consistent with the quality assurance program of Columbia Analytical Services, Inc. (CAS). This report contains analytical results for samples designated for Tier IV validation deliverables including summary forms and all of the associated raw data for each of the analyses. When appropriate to the method, method blank results have been reported with each analytical test.

Sample Receipt

Twenty-seven water samples were received for analysis at Columbia Analytical Services on 6/23/11. The samples were received in good condition and consistent with the accompanying chain of custody form. The samples were stored in a refrigerator at 4°C upon receipt at the laboratory.

General Chemistry Parameters

Total Phosphorus by EPA Method 365.3:
The Relative Percent Difference (RPD) for Total Phosphorus in the replicate matrix spike analyses of sample AMB07-008PS06 was outside control criteria. All spike recoveries in the MS, DMS, and associated Laboratory Control Sample (LCS) were within acceptance limits, indicating the analytical batch was in control. No further corrective action was appropriate.

No other anomalies associated with the analysis of these samples were observed.

Approved by Howard Holmes **Date** 7-12-11

COLUMBIA ANALYTICAL SERVICES, INC.

Client:	Battelle Marine Sciences Lab	**Service Request No.:**	K1105719
Project:	June 2011 Ambient Monitoring (AMB07)	**Date Received:**	6/24/11
Sample Matrix:	Water		

CASE NARRATIVE

All analyses were performed consistent with the quality assurance program of Columbia Analytical Services, Inc. (CAS). This report contains analytical results for samples designated for Tier IV validation deliverables including summary forms and all of the associated raw data for each of the analyses. When appropriate to the method, method blank results have been reported with each analytical test.

Sample Receipt

Twenty water samples were received for analysis at Columbia Analytical Services on 6/24/11. The samples were received in good condition and consistent with the accompanying chain of custody form. The samples were stored in a refrigerator at 4°C upon receipt at the laboratory.

General Chemistry Parameters

No anomalies associated with the analysis of these samples were observed.

COLUMBIA ANALYTICAL SERVICES, INC.

Client:	Battelle	**Service Request No.:**	K1107209
Project:	June 2011 Ambient Monitoring (AMB07)	**Date Received:**	8/4/11
Sample Matrix:	Seawater/water		

CASE NARRATIVE

All analyses were performed consistent with the quality assurance program of Columbia Analytical Services, Inc. (CAS). This report contains analytical results for samples designated for Tier IV validation deliverables including summary forms and all of the associated raw data for each of the analyses. When appropriate to the method, method blank results have been reported with each analytical test.

Sample Receipt

Fourteen ocean water and one water samples were received for analysis at Columbia Analytical Services on 8/4/11. The following discrepancies were noted upon initial sample inspection. The exceptions are also noted on the cooler receipt and preservation form included in this data package. Six other ocean water and two water samples were received broken. The other samples were received in good condition and consistent with the accompanying chain of custody form. The samples were stored in a refrigerator at 4°C upon receipt at the laboratory.

General Chemistry Parameters

Total Organic Carbon by Standard Method 5310 C:
All samples were received past the recommended holding time. The analysis was performed as soon as possible after receipt by the laboratory. The data was flagged to indicate the holding time violation.

The samples were received frozen which may extend the hold time.

One ocean water sample broke while in our sample storage area prior to analysis: AMB07-070-PS01

No other anomalies associated with the analysis of these samples were observed.

Client:	Battelle	**Service Request No.:**	K1107256
Project:	June 2011 Ambient Monitoring (AMB07)	**Date Received:**	8/5/11
Sample Matrix:	Ocean water		

CASE NARRATIVE

All analyses were performed consistent with the quality assurance program of Columbia Analytical Services, Inc. (CAS). This report contains analytical results for samples designated for Tier IV validation deliverables including summary forms and all of the associated raw data for each of the analyses. When appropriate to the method, method blank results have been reported with each analytical test.

Sample Receipt

Twenty ocean water samples were received for analysis at Columbia Analytical Services on 8/5/11. The samples were received in good condition and consistent with the accompanying chain of custody form. The samples were stored in a refrigerator at 4°C upon receipt at the laboratory.

General Chemistry Parameters

Dissolved Organic Carbon by SM 5310C:
Samples were received past holding time. The analysis was performed as soon as possible after receipt by the laboratory. The data was flagged to indicate the holding time violation.

No other anomalies associated with the analysis of these samples were observed.

Approved by Howard Holmes **Date** 8-19-11

9. Did all bottles arrive in good condition (unbroken)? *Indicate in the table below.* NA Y N
10. Were all sample labels complete (i.e analysis, preservation, etc.)? NA Y N
11. Did all sample labels and tags agree with custody papers? *Indicate major discrepancies in the table on page 2.* NA Y N
12. Were appropriate bottles/containers and volumes received for the tests indicated? NA Y N
13. Were the pH-preserved bottles (*see SMO GEN SOP*) received at the appropriate pH? *Indicate in the table below* NA Y N
14. Were VOA vials received without headspace? *Indicate in the table below.* NA Y N
15. Was C12/Res negative? NA Y N

Sample ID on Bottle	Sample ID on COC	Identified by:

Sample ID	Bottle Count Bottle Type	Out of Temp	Head-space	Broke	pH	Reagent	Volume added	Reagent Lot Number	Initials	Time

*Notes, Discrepancies, & Resolutions:*_____

Analytical Chemistry Data Package

Project: ENVVEST Ambient Monitoring September 2011 (AMB08)

Battelle Project No. 54220
CF No. 3106

Marine Sciences Laboratory
1529 West Sequim Bay Road
Sequim, WA 98382
PM: Jill Brandenberger
(360) 681-4564

CHEMISTRY ANALYSIS
DATA PACKAGE CONTENT

ENVVEST Ambient Monitoring
Seawater Chemistry,
Equipment Blanks

Inorganic Chemistry Analysis of Metals in Site Water
Field Data Summary Report 3
QA/QC Summary Reports 12
QA/QC Narrative 28

Sample Custody Information
Laboratory Sample Log-In Form 32
Chain of Custody Form 39
Log-In Checklist 57

CVAF Analysis of Samples for Hg
Analytical raw data available upon request

FIAS Analysis of Samples for As
Analytical raw data available upon request

ICP-MS Analysis of Samples for Metals
Analytical raw data available upon request

Analysis of Conventional Water Chemistry in Site Water
Narrative, Batch K1109025 59
Summary Report, Batch K1109025 60

Sample Custody Information
Chain of Custody Form, Batch K1109025 237
Log-In Checklist, Batch K1109025 241

Analytical raw data available upon request
